

Standards: Flowchart Packages
...and Cassettes

It takes a powerful software library to get the most out of a 330 nsec mini.

Introducing the fully supported VARIAN 73.

What good is a brand-new computer with the hardware capabilities of the VARIAN 73 if you have to wait forever for the software and peripheral systems package?

VARIAN 73 is loaded, right from the start. It was designed to take full advantage of the comprehensive software and peripheral package developed for Varian's 620-series computers. Even the power-house operating-system software packages, VORTEX and MOS, are fully rated on VARIAN 73. And the package includes DAS assemblers for programs written in VARIAN 73 symbolic language. Higher-

language compilers like FORTRAN IV, BASIC, and RPG IV. Mathematical and data conversion packages. Editing, debugging and diagnostic programs. The works.

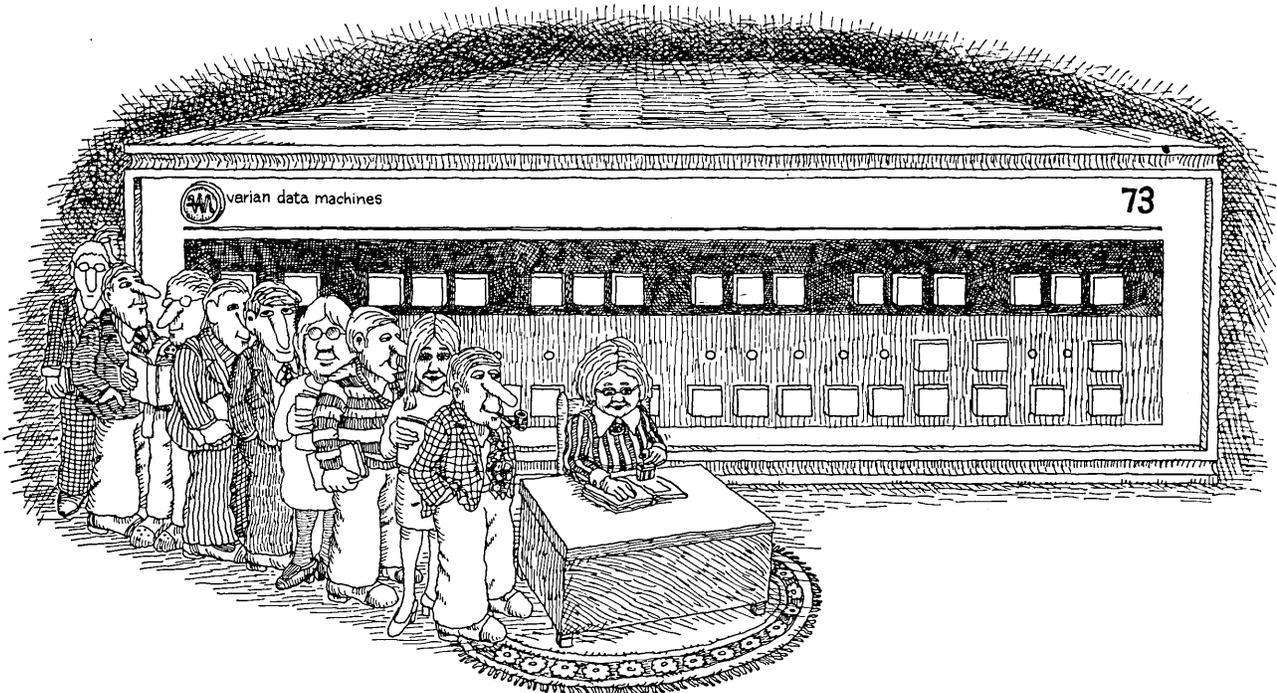

And VARIAN 73 is designed for upward software compatibility with peripheral controllers and I/O devices which you can add on as you need them.

Sound expensive? Fully loaded, VARIAN 73 prices out at less than systems of half its capability. And nowhere else can you buy the combination of super speed, accessible microprogramming, 64-bit control words, and dual asynchronous memory

busses. Nowhere—not at any price.

As VARIAN 73's extendable architecture unfolds over the year, you can expect even more from this powerful hardware/software team. And new Varian incremental building blocks will be announced as they are developed. Like integral floating point hardware. But right now VARIAN 73 with Varian software will solve most of your specific real-time applications. Faster and cheaper. Call or write, Varian Data Machines, 2722 Michelson Drive, Irvine, California 92664 (714) 833-2400.

varian data machines 

LET'S MAKE A DEAL!

600 LINES PER MINUTE: Tally's 600 lpm printer coupled with Tally's exceedingly fast Datascribe Communicator which gives you transmission throughput speeds up to 1200 characters per second using Bell or equivalent modems.

100 LINES PER MINUTE: Tally's super reliable 100 lpm impact printer gives you a third alternative in matching printer speeds to the varying requirements of your remote locations. And they're all plug interchangeable on the powerful, flexible Tally Datascribe Communicator. Let's make a deal.

200 LINES PER MINUTE: For many terminal locations, you can fill the gap perfectly with the Datascribe and Tally's terrific new 200 lpm printer. Completely reliable and completely compatible with forms control loop, movable tractors and excellent print quality on up to 6-part paper.

TALLY

Use the current Data General price list to fill in the blanks. You'll see that DECISION's peripherals are a better deal. DECISION makes only the peripherals for the Nova and SuperNova. We don't build mainframes, CPUs or memories... just peripherals.

Not only do we make the best peripherals, but we also have better software that takes up less core space. All at a lower price. Because our design and production efforts are dedicated to building efficient Nova peripherals.

The best high-performance drive assemblies are used in DECISION peripherals. We use disks from Diablo and Century, and tape transports from Wang... companies with thousands of field proven drive assemblies in use today.

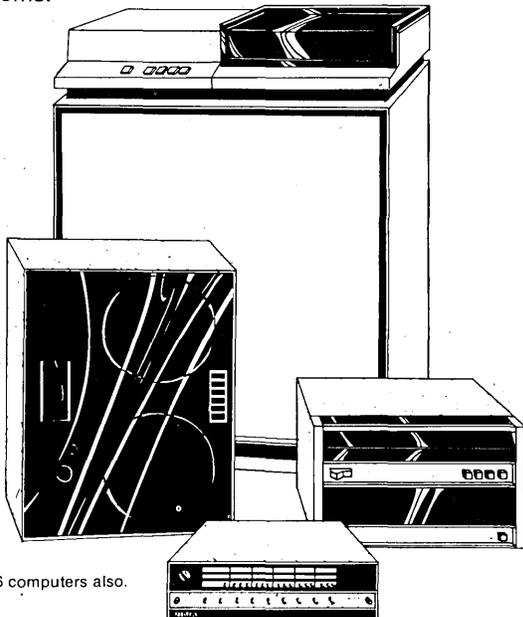

For End Users, we supply complete Nova peripheral systems including drives, controllers and software. OEM's can buy the complete peripheral system or just our controller, with or without software, for integrating into Nova systems.

Either way—we deliver in less than 45 days. DECISION also assumes full system responsibility. Our Disk Operating Systems, Remote Batch Terminals, and Interactive Data Entry Systems are a lot less expensive and more powerful than anything else on the market.

DECISION's Timesharing BASIC for 60 users has full disk file capability and extended BASIC language.

DECISION's Disk Operating System software requires only 700 words of core, is device independent and is fully compatible with all DECISION peripherals. DDOS supports standard Data General software such as FORTRAN, BASIC, and ALGOL.

If you are expanding an existing Nova system, or designing new ones, compare DECISION's price, performance and delivery. For more information, call: 415-654-8626 (San Francisco); 213-348-8522 (Los Angeles); 203-743-7447 (New York); or mail the coupon to: DECISION, INC., 5601 College Avenue, Oakland, California 94618.

*DCC 116 computers also.

When Performance Counts In Data Communications, The Blue Chips Count On TELEFILE LIKE OUR 270X COMMUNICATIONS PROCESSOR.....

at the Chicago Board of Trade, where \$88 billion in commodities were traded last year. Performance responsibility of the IBM 360 and our communications processor is awesome since the Board of Trade insists upon no more than 1 second from the time a trade is entered into the system until it is displayed on the Ferranti Packard wallboard and other "foreign" terminals such as moving displays, ticker tape, or Ultronic CRT terminals. With thousands of dollars riding on every transaction, dependability is a must.

Or our 270X at Executive Computer Systems, where health insurance claims are certified, processed and paid within 24 hours. Insurance companies get rapid access to information, up-to-the-second data on eligibility, claims history, and prior payments. Here, Sanders CRT terminals are connected directly thru the Telefile Controller.

And the fast growing chain of Broadway Department stores with their IBM 370 and at Springs Mills, the world's 3rd largest textile maker, with their IBM 360/65 MP where management information such as inventory control, credit

verification, payables and receivables are handled with the Telefile 270X. You can bet there's a lot of bucks riding on Telefile performance and reliability.

What's your money riding on? Front End Pre-Processing? Data Concentration? Data Transmission Control? We've supplied proven hardware to all of these and other blue chip customers. We offer plug-for plug IBM 2701,2, and 3 compatibility--turnkey installation including software that handles both IBM and "foreign" terminals--IBM software transparent--performance, modularity and options that meet and exceed competition-- an amazing uptime record--nationwide service--and delivery from production.

Ask for our whole success story.

WITH OUR NEW 370/STOR, YOU HAVE NO MORE REASONS TO BUY IBM MAIN MEMORY.

370/STOR is the new add-on and replacement main memory for IBM System/370 Model 155. From Cambridge Memories.

We designed it with one goal in mind: to convince even the most cautious buyer that 370/STOR is far superior to any alternative 370/155 main memory. Judge for yourself.

FIRST, IT'S "FAIL-SAFE!"

In 370/STOR, if a sector of memory fails, it is reassigned immediately to the highest address level, and the rest of the memory keeps running. That means almost zero downtime due to memory failure. No other memory has such a feature.

FACT # 2. IT IS EXTREMELY COMPACT.

One 370/STOR unit has the capacity of four IBM memory cabinets. We store up to two megabytes in the same space that IBM stores 512 kilobytes. That saves floor space, machine room changes, and time during upgrade. No other memory has such a feature.

FACT # 3. IT IS FIELD-EXPANDABLE.

After you install a minimum 370/STOR module, we can expand it up to an additional 1.75 megabytes by simply plugging cards into your installed unit. As a rule of thumb, figure that we can add about 512K bytes in about two hours. It's as easy as opening two cabinet doors. No other memory has such a feature.

FACT # 4. NO COSTLY CENTRAL PROCESSOR MODIFICATIONS.

To add IBM memory to your Model 155 requires processor modifications. These cost from \$12,000 to \$125,000, depending upon the number of "ports" your memory uses. 370/STOR uses only one port per two megabytes, so there is absolutely no requirement for processor upgrade. That alone can be a huge savings. No one else offers such a feature.

FACT # 5. WE'LL GUARANTEE 72-HOUR EXPANSION.

Once you install a 370/STOR memory, we will upgrade it within 72 hours after contract approval if you desire. Our experience as one of the largest suppliers of add-on core for System/360 taught us that when a user wants more memory, he wants it fast. And let's face it, we want to make a point: no one else could possibly offer such a service.

FACT # 6. THE PRICE STORY.

We saved the best for last. 370/STOR saves you from 30 to 60 per cent, not including the substantial processor savings that you'll enjoy. To convert that to dollars: two megabytes of memory from IBM costs approximately \$1,000,000. From Cambridge, it costs \$480,000. You save over a half a million dollars. Our lease terms are just as attractive.

370/STOR is completely hardware and software compatible with any of the seven models of the 370/155, in case you had that concern. And although its unique operator console makes maintenance a breeze, we service 370/STOR from over 150 locations in the U.S. So you can put that issue aside.

That's our story. Since you're probably a cautious buyer, call our local sales office and make us prove our pitch.

If you don't buy what we say, call anyway. We want to know what else you'd like your memory system to be.

CAMBRIDGE.

**“Until we had our Yellow Pages ad,
most of our business came through referrals.”**

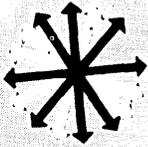

“Now that we have a Yellow Pages program, we get a lot of business from people who find us through the Yellow Pages,” says Mr. John Banjak of Data Utilities of North America, Newton, Massachusetts. “Every month we have quite a few unsolicited inquiries, and since they are unsolicited, we know they’ve come through the Yellow Pages.

Ours is a young, growing business, and the business we get from the Yellow Pages is very important to us. Of course, we got professional help from the Yellow Pages representative in planning the ad. He is part of the reason our Yellow Pages program is so successful.”

Let the Yellow Pages do your talking. People will listen.

**3 out of 4 prospects
let their
fingers do the walking.**

Look Ahead

THE MEMORY LINGERS ON

A couple of weeks after IBM touted its 370/VS announcement as one of the most important in the history of the industry, a few people gathered quietly late last month to honor the 10th birthday of the first machine to offer virtual memory.

Still working away at the old ElectroData plant in Pasadena is a Burroughs B5500 (serial No. 101) that began life in 1962 as a 5000, offering relocatable programs "completely independent of actual storage addresses and the hardware configuration," according to a manual. Burroughs is pleased that IBM has blessed its ancient concept.

VS1--EARLY SATISFACTION AT TEST SITES

San Diego Gas and Electric Co. achieved a 10-15% increase in throughput in field tests of IBM's OS/VS1 on the utility's 370/145 with 256K of main memory. Other reports of "general satisfaction" with the virtual memory extension of MFT in IBM's announcement (see p. 58) began to trickle out of installations where it was tested this spring...although IBM has said the new control might not have been loaded enough for the test sites to give it a thorough evaluation.

The San Diego spokesman, Michael Riley, said he had 140K bytes of real memory to use after the system was loaded and found that optimum performance was achieved when a two-megabyte virtual was run, although four and three megabytes were tried. At a second test site, where VS1 ran on a 370/145 with 160K, the user found that running a virtual memory of more than a million bytes was "a waste of time--just as IBM had told us." Currently, it is running two 128K partitions which will be expanded to 192K soon.

At McDonnell Douglas in St. Louis, tests with its 256K machine on two megabytes of virtual memory shows the system is "very good" at replacing MFT for the same job stream--that is, jobs written for the 256K machine. A spokesman adds, "It's one of the cleanest initial releases of an operating system we've ever seen." He thinks about 80% of the OS code is intact, with most of the changes isolated and localized. But they do not agree completely with IBM's claim that programmers don't have to worry about memory management. "For example," a spokesman explains, "if a job uses virtual memory inefficiently--by jumping around within the program too much--it affects not just the performance of the job being run, but the entire system, because the paging rate goes up."

And Riley said he was experiencing problems running IBM's Customer Information Control System (CICS) under VS1. Every time CICS bombed, it took VS1 with it, he said.

THE 360 MARKET--TWO VIEWS

One effect of IBM's blessing on virtual memory will be a hasty exodus of 360 users to the 370 line. That's the reasoning of California Computer Products, Inc., which was in the midst of auditing its report for the fiscal year ended June 30 when IBM made its announcement. The company said the action reduces the value of its 2311- and 2314-like disc drives out on lease and that this and other accounting changes probably would require it to report a loss of \$12 million on revenues of \$53 million.

Others see a short-term boom at the high end of the 360 line--especially in the 360/65 market where machines coming off lease can

Look Ahead

be secured at rates 60% below the IBM rental price. Users needing expanded capacity may enter a "holding Pattern" during the two years it might take to debug the 158 and 168 systems. Into that holding pattern would enter the 65 and lower priced but higher performance peripherals from independents.

A "BLESSING" OBSOLETE

Just when the 1,024-bit semiconductor memory was blessed by IBM in its 370/158 and 168, Four-Phase Systems has come along with a computer using 2,048-bit chips. A new processor--the model 7002, being announced this month for the company's System IV/70--has eight memory cards, a maximum 98K bytes of storage, and supports 32 1,152-character crt terminals. The earlier 1,024-bit processor, also with eight cards, had a maximum of 24K bytes and supported only eight terminals. First to deliver an LSI computer, a year and a half ago, the Cupertino, Calif., firm is said to have more than 200 System IV/70s installed. Systems with the new processor are being installed at Western Union's subsidiary, Teleprocessing Industries, Inc., which is setting up new telegraph entry centers around the U.S.

DECSYSTEM PRICES SLASHED

Price slashes of 15-37% on Digital Equipment Corp.'s DECSYSTEM-10 line are largely attributable to production economies the company achieved by buying RCA's memory products division. DEC this month will price its KI-10 processor at \$240,000, a 37% reduction. It is knocking 27% off the price of the 1040 and 35% off the dual processor 1077. Look for the reduction to spill over into DEC's minicomputer line, because the firm plans to use the same core stack on minis as it does on the DECSYSTEM 10. In a related move, the company said it will give customers allowances on DECSYSTEM-10 equipment that is replaced by more advanced machines.

GROUP TO "ASSESS" ASCII STANDARD

The National Bureau of Standards is expected to announce an "assessment" of the federal ASCII standard--the American Standard Code for Information Interchange. Assessors, composed of suppliers and users, will explore the following matters, among others: How to increase the standard's user appeal; whether facilities should be established to validate ASCII-dependent hardware and software; and whether to change existing implementation procedures to assure greater compliance. The study is supposed to be finished next May.

Meanwhile, ANSI's X3 group has asked its members whether they want to make computer data files more compatible with ASCII code. Basically, this would be done by writing a standard, covering frequently interchanged files, that would ban the use of properties which are unique to a computer's internal code and can't be handled in ASCII--for example, packed numerics.

NONIMPACT PRINTERS EMERGE FROM LABS

Two new companies out west have entered the nonimpact printer market. One of them, ElectroPrint, Inc., of Cupertino, next month will announce an 8,000-lpm device that applies a liquid toner to plain paper. Its characters are formed from a 7x10 dot matrix, and a maximum line is 136 columns. Across that width, says ElectroPrint's James Sutherland, the device will print 100 dots per inch and thus can be used for plotting.

In Bellevue, Wash., fledgling Sector Corp., which is still wooing

If you're responsible for getting payroll checks to remote locations, you know how important it is that they be delivered on time. Sycor's Model 340 Intelligent Communications Terminal now frees you from the nagging concern that a payroll might be delivered late.

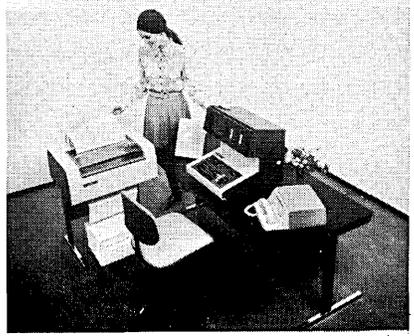

Payroll report data can be captured at remote locations on the Sycor 340, where it is automatically checked and edited for accuracy. At the push of a button, the 340 transmits the data at high speeds over the public switched telephone network to a CPU using sophisticated binary synchronous procedures to assure that no data is lost and no erroneous data is received. The processed data then can be sent back, unattended, for printing of payroll checks at the site via any of three types

of dependable Sycor printers (30 cps, 165 cps and 200 lpm).

As a result, your payroll is prepared quickly, economically and accurately; your employees are paid on time; and you stop worrying.

The Sycor 340 can do this job, and most any other you might have, because Sycor provides users with T.A.L. (Terminal Application Language). With T.A.L. you can write sophisticated programs tailored to your own terminal applications for execution in an optional one microsecond terminal memory.

Want to know more? Call us at (313) 971-0900, or drop us a line. We'll be glad to tell you more about how the Sycor 340 can help to meet your payroll.

The Sycor 340 Intelligent Communications Terminal.

Burroughs

THE B 1700

REVOLUTIONARY

POWERFUL NEW SMALL-SCALE COMPUTERS FOR THE PROFESSIONAL EDP MANAGER

... who wants the advantages of fourth-generation technology—

The B 1700 Systems are the first small computers with these larger-systems benefits:

Speed and efficiency

- Processor speeds up to 6 megaHertz
- IC memories up to 98,000 bytes; effective speeds of 222 nanoseconds per byte
- Bit-level addressability for efficient memory utilization
- Variable micrologic for processing COBOL, FORTRAN, RPG, and BASIC at full efficiency
- Automatic multiprogramming for higher throughput
- Fully buffered I/O channels for full-speed operation of processor, peripherals and terminals

Flexibility

- Virtual memory for accommodating programs of any size
- Central site operation concurrent with data communications
- New 96-column card peripherals (including switchable on-line/off-line models) ... 80-column card equipment ... new line printers ... new MICR document reader sorters ... new magnetic tape drives ... new high speed disk cartridge drives

Ease of use

- A Master Control Program for complete self-regulation (like Burroughs larger systems)
- Ready-to-use application programs available now for: Wholesalers ... Distributors ... Manufacturers ... Banks ... Hospitals ... Accountants ... and ready soon for Government ... General Contracting ... Credit Unions ... Savings and Loans ... Auto Dealers ... Utilities ... Schools and Universities ... with many others to come
- Upward compatibility of systems software and application programs throughout the B 1700 series for economical expansion, long range investment protection

... who may be planning a large, distributed processing network—

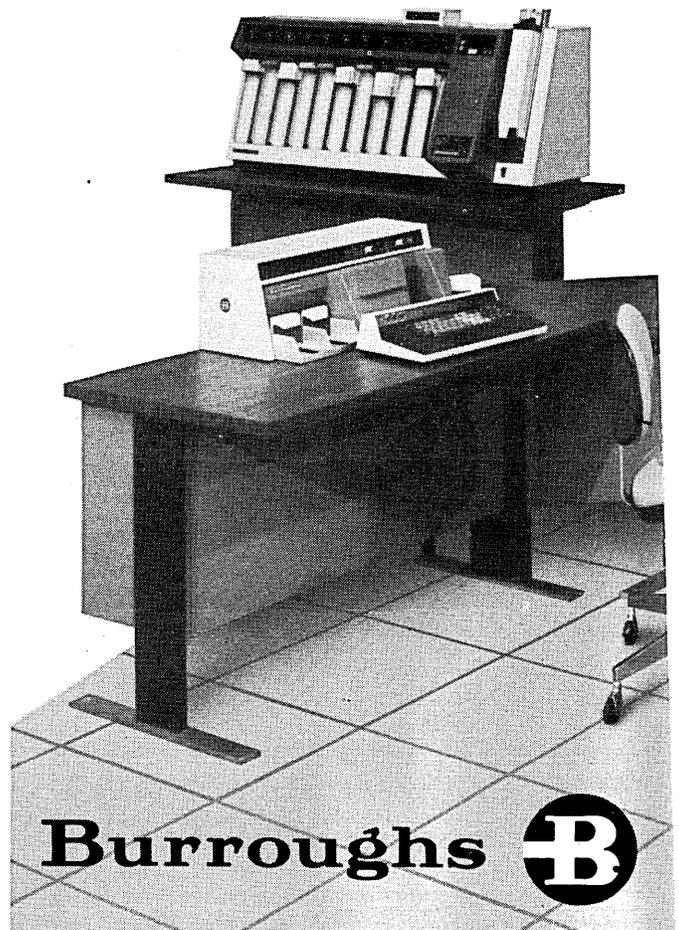

You can install low-cost B 1700 Systems in plants, warehouses, local offices—wherever data needs to be captured and organized for interaction with a central system, or processed into action information for your field people. In addition to the B 1700's new peripherals and data file subsystems, you can use Burroughs wide range of terminal systems in meeting your exact application needs.

... who is concerned with conversion costs and reliability—

B 1700 Systems can accept RPG, COBOL or BASIC programs prepared for other small systems and, in many cases, run them with measurably improved efficiency. Additional micrologic interpreters are being developed to provide efficient processing in a variety of other languages. Burroughs also offers conversion aids to help you move up to higher level languages. B 1700 high reliability design is supported with fast, positive diagnostics, and by field engineers who are trained and equipped to assure you of more hours of uninterrupted system use.

The exciting new B 1700 Systems are being delivered *now*. They demonstrate Burroughs continued success in developing advanced electronic systems that can serve you more effectively and, at the same time, lower the true cost of data processing!

... large system management reporting abilities
... ready-to-use programs from a library of Business Management Systems
... a Master Control Program for system self-regulation and multiprogramming (for the first time in systems of this size)

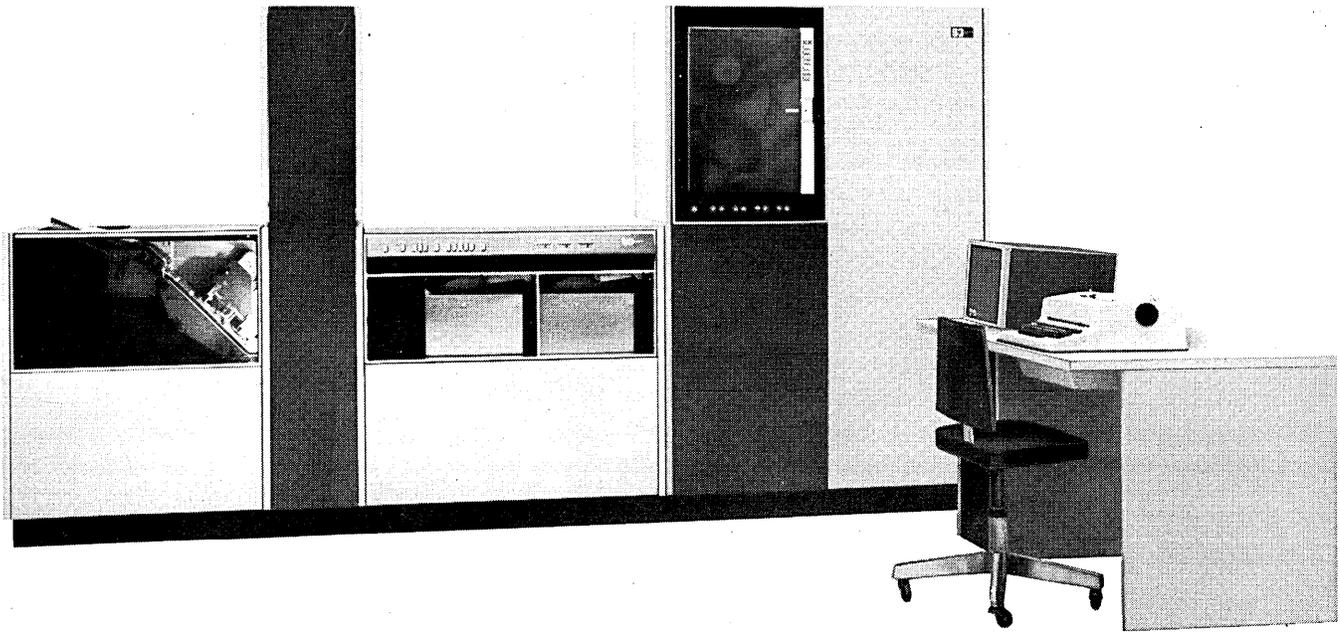

announces SYSTEMS

FOURTH-GENERATION SMALL COMPUTERS WITH

... the ability to process a variety of computer languages at full efficiency
... superior new 96-column card-handling capabilities (as well as 80-column card equipment)
... two new line printers, two new MICR reader sorters, plus two new magnetic data

file subsystems
... simplified operation and system management
... exceptional flexibility in application and responsiveness to change
... new levels of cost/effectiveness!

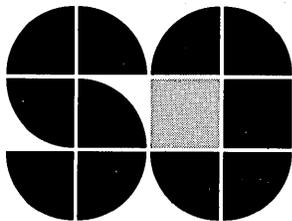

input?

Problem: At least 30% of your data processing dollar is spent on input. The key to solving your data input problem is not keypunch, or keydisk, or key verifier, or keytape, or key anything else. The real key is the Scan-Optics 20/20™, the versatile, high-thruput, low-cost Page/Document optical character reader.

The 20/20 is the off-line, direct data input system that not only obsoletes keyboard systems . . . but has a Cost-Performance ratio that practically obsoletes all other readers.

Proof? Send us the coupon. We'll send you facts, figures, and case histories of actual users such as banks, insurance companies, publishers, service bureaus and others. It just may be *your* key to data input!

Tektronix introduces
APL GRAPHICS
for less than \$6K

If your computer is speaking APL or soon will be, Tektronix has an APL System for you. It's the 4013. The first off-the-shelf computer display terminal with full ASCII, graphics and PLOT-10 APL/GRAPH Software.

This new APL System has joined the Tektronix family of terminals for the business end of your computer. The 4013 brings graphics to the full APL character set. Hard copy unit, and a full line of peripherals.

Tektronix, Inc.

getting more out of the business end of your computer

NCR Paper's Self-Contained story is all one-sided.

You get an image on one side only. Yet that's only one of the reasons that Self-Contained NCR Paper is the best of all self-imaging carbonless papers. Our one-sidedness gives us a couple of plus points--one, you can back-print if you need to and two, it's a cleaner, neater piece of paper (it doesn't look like you put a piece of carbon paper in backwards behind it). In addition, Self-Contained NCR Paper makes crisper, more intense, more splash-free images than any other system. There's no better self-contained than the one from the leader. Self-Contained NCR Paper.

Extra added attraction:
Self-Contained CB for the
best of both worlds.

This is the year
NCR Paper means business!

NCR Paper. Appleton Papers Inc., P.O. Box 348, Appleton, Wisconsin 54911, Subsidiary of NCR.

Microdata moves into systems

Microdata, the company that made microprogramming irresistible, has moved into systems. We now offer all the modules, peripherals, software and application firmware you'll need to configure a high-performance system at a low price. Pick the items you need and add up their costs. Then compare the total with anything you get from our competition. You'll see what we mean.

<p>System Computers</p> 	<p>Series 1600 Computers—CPU with power fail/auto restart, ROM control memory, real time clock, tele-type controller, power supply, card cage and system control panel. Typically, \$4,000</p>	<p>Model 2208 Magnetic Core Memory—8,192 byte, 8-bit module (up to 8 modules per computer). \$1,800</p>				
<p>Utility Interfaces</p> 	<p>Model 2510 Byte I/O Controller—provides independent input and output controllers each with 8-bit data transfers. \$800</p>	<p>Model 2511 Full Word I/O Interface—provides 32 input lines and 32 output lines with data transfers under program control. \$700</p>	<p>Model 2512 Priority Interrupt Board—provides 8 levels of priority interrupt with individual arm/disarm. \$550</p>	<p>Model 2513 Selector Channel—operates by way of direct memory access, accommodates up to four I/O devices. \$850</p>		
<p>Communications Interfaces</p> 	<p>Model 2601 Synchronous Modem Interface—has auto call/answer unit, accommodates standard rates up to 9600 baud. \$1,200</p>	<p>Model 2610 Asynchronous Communications Controller—single channel, full duplex, programmable baud rates to 9600 baud. \$500</p>	<p>Model 2612 Asynchronous Communications Controller—provides simultaneous operation of 8 full duplex asynchronous channels. \$1,600</p>	<p>Model 2613 Asynchronous Modem Interface—provides simultaneous operation of 8 full duplex 103 and 202 type data sets. \$2,000</p>	<p>Model 2620 Modem/Communications Control—provides 16 discrete inputs and 16 discrete outputs. \$800</p>	<p>Model 2630 Automatic Call Unit Controller—provides control function for four Bell Model 801 automatic call units. \$950</p>
<p>Peripheral Systems</p>    	<p>Model 2710 Paper Tape System—300 cps fanfold 8-channel reader, 75 cps fanfold 8-channel punch. \$3,955</p> <p>Model 2810 Magnetic Tape System—with one 7", 9 track, 800 bpi, 10,000 bytes/second transport and controller for up to four transports. \$4,630</p> <p>Model 2823 Magnetic Tape Transport—8½" reel, 25 ips, 9 track, 800 bpi. \$3,020</p>	<p>Model 2720 Card Reader—300 cpm, 80 column cards. \$3,750</p> <p>Model 2811 Magnetic Tape System—with one 7", 9 track, 800 bpi, 20,000 bytes/second transport and controller for up to four transports. \$4,760</p> <p>Model 2851 Disc System—includes disc drive with moving head removable cartridge, 2.4 million bytes, 75 ms random access, 200 kb transfer rate. \$11,730</p>	<p>Model 2731 Line Printer—80 column, 64 character set, 356 lpm. \$9,750</p> <p>Model 2820 Magnetic Tape Transport—7" reel, 12.5 ips, 9 track, 800 bpi. \$2,830</p> <p>Model 2852 Disc System—includes disc drive with moving head (one fixed and one removable), 4.9 million bytes, 95 ms random access, 200 kb transfer rate. \$12,750</p>	<p>Model 2732 Line Printer—132 column, 64 character set, 245 lpm. \$12,500</p> <p>Model 2821 Magnetic Tape Transport—7" reel, 25 ips, 9 track, 800 bpi. \$2,960</p>	<p>Model 2822 Magnetic Tape Transport—8½" reel, 12.5 ips, 9 track, 800 bpi. \$2,890</p>	<p>TOTAL \$</p>

TM trademark Microdata Corporation

Our slot machines.

Our D-116E has 17 slots.
(Nova's 1220 has 10).

Our D-116 has 7 slots.
(Nova's 1210 has 4).

As you can see, our fully compatible D-116 series of 16 bit mini-computers gives you a lot more slot space than their 1210 and 1220 counterparts.

About 40% more, in fact. The D-116 has a 32K capacity plus one extra slot while the 1210 has only 16K capacity with no extra slots. And that means a whole lot in terms of versatile options and peripheral interfaces that can be ordered with our D-116 series.

How did we do it? By keeping our power supplies modular (and replaceable). The 1210 and 1220 power supplies, on the other hand, are hardwired to the backpanel. It takes a major overhaul just to replace one. (Ours is a snap).

Other features? How about no audible frequency noise from the power supply, reduced conducted RFI from the AC line plug, and cooler air for the logic and memory boards. (Boy, does it get hot with the 1210/1220 power supply under the boards).

And that's the story of our slot machines. Except for one thing. Their price. Twenty percent lower on quantity one! Twenty percent.

This time you really hit the jackpot.

PMI'S High Technology Capability Pays Off...

IN DESIGN VERSATILITY...COMPATIBILITY... AND ADAPTABILITY OF HEAD-PER-TRACK DISC STORAGE DEVICES.

PMI produces a complete product line of **high-technology** head-per-track disc storage devices featuring high recording densities up to 6,000 bpi, that results in higher data throughput of from 4.5 to 51.2 MHz at a lower cost-per-bit for a given capacity—the 010 Mini Series with access times of either 8.5 ms or 17 ms and capacities from 1.2 Megabits to 19.2

Megabits and transfer rates of 4.5 to 6.4 million bits per second — and the larger capacity 100 Series with access times of either 8.5 ms or 17 ms; capacities of 19.2 Megabits to 153 Megabits and transfer rates of 4.5 to 6.4 million bits per second.

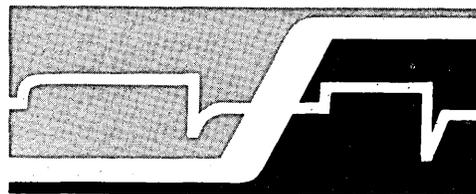

The 100 Series also has the capability of operating up to 8-track parallel, providing transfer rates of up to 51.2 million bits per second.

PMI's higher recording densities require fewer components per storage device and this adds up to a **higher reliability prediction** for a given capacity.

The entire product line has interface compatibility with most other head-per-track disc memory systems. Utilize the PMI design versatility for device, system and sub-system compatibility and you can adapt any PMI device to your particular requirement. Some of the standard features incorporated into the PMI product lines are: non-contact, fail-safe heads that fly at 40 micro-inches; automatic head lifters that sense low disc speed, D-C power present, and high head actuation pressure; integral D-C power supplies with A-C line filter; field-expandability; 10,000 hour MTBF and 1 hour MTTR.

PMI offers customer service and representation in London, England and Tokyo, Japan.

Prices start at \$4,000 in single unit quantities. Evaluation units are available immediately for all qualified O.E.M. manufacturers. *For complete information and special quantity discounts, write or call:*

IBM introduces Virtual Storage for System/370.

A major part of your data processing investment is in the people who work with your computers.

Virtual storage is designed to help them become more productive.

Virtual storage is designed to make System/370 more versatile, flexible and responsive. It can increase the productivity of programmers by freeing them from much time-consuming and routine work.

Yet for all its revolutionary implications, it is an *evolutionary* development, involving no major reprogramming of most applications.

Increasing the computer's efficiency

Virtual storage is simply a way of making more efficient use of a computer's main storage (also called "memory") in most applications.

Instead of holding an entire program in main storage throughout its execution, only those parts actually needed by the computer

are brought in at any given time. The rest is kept on disk files, ready for immediate use.

Virtual storage thereby lifts many of the restrictions previously imposed by the physical size of main storage.

It gives an apparent main storage capability that is vastly greater than the computer's real storage—up to 16 million bytes. That is four times greater than the *real* main storage of IBM's largest computer.

More jobs, more functions

Virtual storage can greatly broaden the range of applications feasible for an IBM System/370.

It can permit more jobs to be run concur-

rently. Larger jobs. More on-line, remote terminal jobs. It can thereby potentially expand the capabilities of computer installations. Individual programs, however, may require more time for execution under virtual storage.

It has the potential to reduce the time and work required for developing, testing and maintaining new applications. It opens up exciting new prospects for program design.

It permits many jobs to be interchanged between large and small System/370 machines. To the extent that jobs can be interchanged, a smaller machine can now back up a larger machine.

Compatible growth

Virtual storage capability can be provided by a simple on-site engineering change in System/370 Models 135 and 145. At no charge.

If you own a System/370 Model 155 or 165, virtual storage capability will be available at additional cost. These enhanced computers will be known as the Model 155 II and the Model 165 II.

Four new operating systems support virtual storage on System/370. In addition, a major new access method, called VSAM, facilitates advanced on-line and data base applications.

In many cases, existing System/370 and

System/360 programs can be run under virtual storage with little or no change.

Two new models in the System/370 line

IBM also announces two new System/370 models, both equipped with virtual storage capability and advanced all-monolithic technology. They are the Models 158 and 168. They provide the greatest computing power of all IBM's virtual storage models and continue the logical evolution to greater function and higher productivity for data processing installations.

An advance in productivity

As the needs for data processing become more numerous and complex, so do the demands on the computer. And particularly on its main storage capacity.

By more effectively using that capacity, virtual storage makes possible expanded computer use.

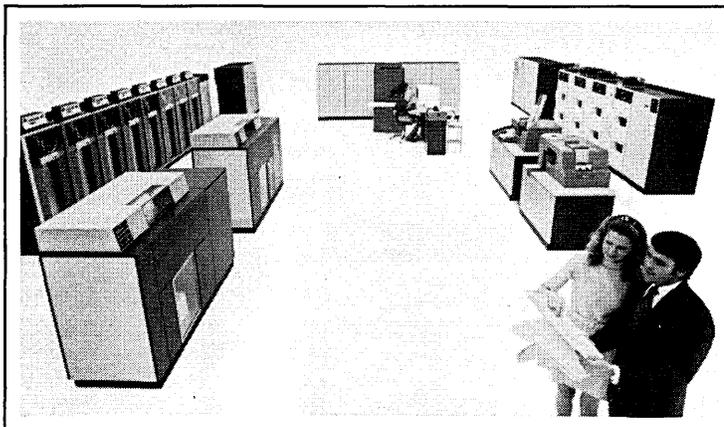

It allows more jobs to run concurrently.

It permits many applications to be developed more easily and rapidly.

Virtual storage. Another way IBM adds to the value of your data processing investment.

IBM

The new IBM System/370 Model 158 features instructions designed to speed up the central processing unit, as well as an operator's console with a lightpen for systems control.

The new IBM System/370 Model 168 has a real storage capacity of up to four million bytes. It has the ability to handle 12 channels for high-speed devices.

How to reduce Data Input Keystrokes by as much as 62%.

Data input costs can consume as much as one-third to one-half of the EDP budget of high-volume computer sites. Much of this expense is due to the need for keystroke verification. Now, Consolidated Computer introduces its KEY-EDIT® Output Editor, a powerful and sophisticated data manipulation capability that can significantly reduce the need for keystroke verification.

KEY-EDIT's Output Editor is capable of editing, validating and reformatting data resident on the Fixed Head Storage Device of the KEY-EDIT data input system. The result is increased efficiency, decreased turnaround time, faster throughput, and a lower cost of data preparation and entry. For instance, in one typical application involving the processing of sales orders, conventional input methods required 376 keystrokes. The KEY-EDIT® Output Editor reduced the required keystrokes to 126—a savings of 62%.

KEY-EDIT and its Output Editor can achieve data input savings for you. We can make this claim because we can back it up with successful case histories in virtually any field of endeavour. The KEY-EDIT System is working in 13 countries throughout the world, in Manufacturing, Government, Insurance, Finance, Transportation, Education, Medicine... you name it, KEY-EDIT applies. And works.

Let us show you how the KEY-EDIT System can work for you. Just phone or send in the coupon below.

Amen

While reading Dick Schubert's article ("Basic Concepts in Data Base Management Systems," July, p. 42), I detected what may very well turn out to be the creation of a new word for the English language. On p. 44, Mr. Schubert says: "The smallest unit of named data in a data base is a *data item*."

Now, sit back, stare at the ceiling, pretend you are Jean Shepard for a few minutes, and let your imagination take over: You can see it now—in a few years, maybe months, somebody will get lazy and make a contraction; thus, "dat'em." Then, before you know it, we will have "datem," "dat'm," or maybe "datum." Lo! Behold! Just what every programmer has always wanted (and feared)—a singular form for "data"!

ED DEWAN
Urbana, Illinois

Lost in the transcription

In the discussion in Look Ahead in the June issue (p. 8) of the publication of *Government Regulation of the Computer Industry*, coauthored by Bruce Gilchrist, Executive Director of AFIPS, and Milton R. Wessel, you state that "ACM's Executive Committee voted to protest the book and censure Gilchrist." In fact, neither of these claims is true.

The ACM Executive Committee was concerned about the mechanism by which publication of a book on such a controversial subject was approved by the AFIPS Board of Directors. Because of this concern the ACM Secretary was directed to write and did so write a letter to the AFIPS President expressing this concern and pointing out that AFIPS involvement in issues of this nature might raise, as you noted, constitutional questions for ACM. But, as the minutes of the ACM Executive Committee clearly indicate, there was no vote to censure Bruce Gilchrist or to protest the book itself.

ANTHONY RALSTON
President
Association for Computing Machinery
New York, New York

Our reporter replies: DATAMATION accurately reported what I had been told by ACM's outgoing president Walter Carlson, a corporate marketing consultant at IBM. Carlson said ACM's three-man executive committee met to discuss the book. Carlson added that he disqualified himself from the deliberations, in which it was voted to protest the book and censure Gilchrist, although he did sit in on the proceedings. Later, after DATAMATION had gone to press, Carlson called me to say that he had reviewed the notes of the ACM

executive committee and found that there had been no vote taken to censure Gilchrist. The whole incident raised another important question about the book, which Mr. Ralston says is about "such a controversial subject." There were attempts at the Spring Joint Computer Conference to suppress the book itself as well as promotional material about it. In at least two instances, IBM officials were involved. We hope that the mere fact that the book or issue is regarded by some as controversial does not mean that the book or the issue will be subject to attempts to suppress it.

Sociogram

In reference to Richard Schubert's article, some important questions and comments should be made.

Although currently not used in a multiprogramming environment, the IBM BOMP (Bill Of Material Processor) file maintenance and access system is the data base management system which most closely resembles the proposed CODASYL DBTG data systems language that I have seen. BOMP's major shortcomings are:

1. As the interconnection between "owner" and "member" records becomes complex, the ability to maintain, update, or extend these files becomes extremely difficult due to the large number of pointer relationships and the large number of accesses required to change them.

2. Any volatile or rapidly changing file, such as raw inventory, open order, or purchase order files, requires such a large overflow, or additional chain area, that direct access speed drops quickly.

3. As files become large, the "chains" constructed between "owner" and "member" records become very long; therefore, long periods of processing time, several minutes or more, may be required to find one piece of information.

The data base management system described in the article addresses none of these problems, and, in fact, seems to allow almost unrestricted chaining between record types, creating greater difficulties in the areas mentioned above.

I must assume that some solution to these problems has been found. If so, I look forward to a subsequent article, or would appreciate a reference where such solutions are addressed.

LONDON MILLER
Seattle, Washington

Mr. Schubert replies: I can't really address myself to the current shortcomings of BOMP. Integrated Database Management System (IDMS) does not restrict the number of set relationships or the complexity of structure which can exist between record types. IDMS automatically maintains all set relationships in the data base and relieves the programmer of this responsibility. In our experience, IDMS does not exhibit the performance problems you mention. The lower portion of the TOPSY data structure shown in Fig. 7 of the article is

volatile and performs well. In my opinion, the solutions to the problems you raised have been resolved by the design of IDMS. An article comparing the performance of BOMP and IDMS on a problem with a complex data structure is an attractive possibility and may begin to fill a current gap in literature.

Our gang

The June issue (p. 131) carries a story about me and some other people at Control Data, and I feel that I have to straighten out the record in some minor but perhaps important details.

The article has a sentence that he "remains on the friendliest terms with the Norris gang." I certainly would not use that expression to describe the top management of Control Data, but it is certainly true that I remain on the friendliest terms with Mr. Norris and other people at CDC. Also, there is a sentence which says "As Rabinow puts it: The economics of the OCR business no longer permit much basic research." I can't imagine my saying this because I don't agree with this. It is true that OCR is now entering a mature phase of business, but there is much basic research to be done.

As you correctly stated in the article, I initiated the reorganization of the OCR Div. of Control Data, and it was my recommendation that the research group be combined with the engineering group because I felt and still feel that—in most industrial organizations—research, advanced development, and good engineering have to be done together. This is particularly true in a small division like the OCR Div. of CDC.

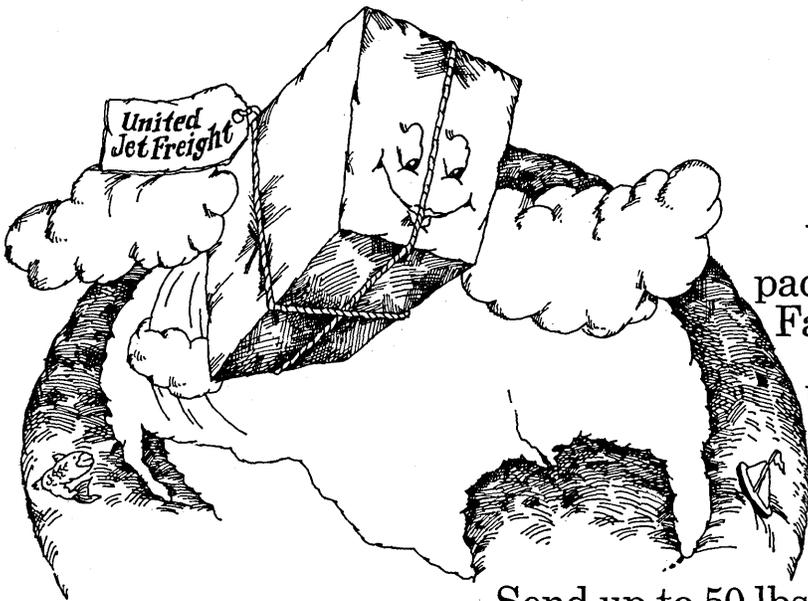

JACOB RABINOW
Acting Chief, Office of
Invention and Innovation
National Bureau of Standards
Washington, D.C.

Time bomb

Your July issue's "News in Perspective" flashes: "Embattled Codasyl Group Now Sees Support for Data Language Report" (p. 82). Angeline Pantages takes a superficial look at the (currently anemic) debate on data base management standards and instructs us: "For the irrationalities and politics behind the data base embroglio, read on," promising us some "knowledge of the play behind the technical scenes."

Since most of your readers who have been in edp for more than three months probably already know that marketing strategies strongly influence the *official*, documented position which any computer manufacturer takes regarding standards proposals, Ms. Pantages' catalogue of the piddling barbs which have been tossed back and forth during the past two years add fuel but not many lumens to the pro-

United's Small Package Dispatch. Same-day delivery to 113 cities.

We'll take your important package anywhere we go. Fast. Economically.

Just take your package to United's Passenger Check-in Counter at your airport. Then have it picked up at the destination. The same day.

Send up to 50 lbs. Just keep your package under 90 inches in total dimensions.

Next time you need to send a package fast, get help from a friend. United.

Send for our free booklet on this speedy service.

United Air Lines
Jet Freight *No. 1 in the U.S. sky*

Just check in 30 minutes before takeoff. Your package is ready for pickup 30 minutes after arrival. It's that fast.

United Air Lines, Inc.,
111 N. Canal St.,
12th floor
Chicago, Illinois 60606

Attention: Mr. Frank Conway

Send me information on your Small Package Dispatch service.

verbial fire. In fact, it would all be great fun to read about and watch were it not true that the fire is really a smoldering fuse connected to a camouflaged stick of dynamite which some edp installations might very soon be using as a child uses a popsicle, and the results probably won't be limited to sticky fingers.

For those interested in some of the technical issues in the DBTG report, especially as they might pertain to a planned utilization of integrated data base capabilities within the next two years, may I recommend "An Analysis of the April 1971 Data Base Task Group Report," by R. W. Engles, a paper presented at the 1971 ACM SIGFIDET Workshop.

For those interested in some of the technical alternatives to the set of implementations strongly implied by the DBTG's proposed Data Manipulation Language, may I suggest "A Relational Model of Data for Large Shared Data Banks," by E. F. Coll (*Comm. of the ACM*, Vol. 13, No. 6, June 1970), and "A Data Base Sublanguage Founded on the Relational Calculus" by the same author (IBM Research Report RJ893, #15716, dated July 26, 1971).

I am currently participating in an application design/implementation project, the "data base management" part for which the latter two monographs provided a strong technical foundation. Though our particular implementation employs procedural rather than interpretive materialization of relations for the sake of application-dependent efficiencies, we have also enjoyed the benefits of:

1. A simple linear view of very complex hierarchical and network structures, with a negligible cost in performance and many unexpected blessings (e.g., faster-moving, more productive design meetings).

2. A GET/PUT type of procedural interface to the data base (something like the interface to an indexed-sequential file).

3. A decrease (not increase) in data base application program debug time; since relations can be represented as arrays, module logic can be checked out prior to the availability of the "data base management" modules.

It seems clear that these benefactions would be very attractive to most users, yet the proposed DBTG standard may preclude them. Thus we can see that there is a lot more under the rug than the little pile of dirt Ms. Pantages managed to discover.

D. WESSLING
Billerica, Massachusetts

Dear Judge Neville,
I have been observing the IBM antitrust suits with much interest. I find it an injustice to allow IBM to continue with their current strategy considering the past history concerning monopolies.

General Motors Corp. is only allowed to consider the dollar volume sales of cars that are sold in measuring its percentage. It is not allowed to include the service stations, body repair shops, dealers' maintenance shops, auto parts stores, or any other business that is an off-shoot of the one product that General Motors makes—"the automobile." I do not see why IBM receives the special privilege of including all the off-shoots of the computer industry, such as service bureaus, software houses, peripheral manufacturers, etc., in measuring its percentage. IBM should be measured the same as General Motors; i.e., what percentage of the dollar volume sales of mainframe computer equipment does IBM have?

Only when IBM does not have a monopoly will the computer industry be able to grow at a rate which is not dictated by IBM. For without competition, we would not have "The American Way of Life"—but, instead, "The IBM Way of Life."

JOHN PREWITT
*Director, Computer Center
Southwest Texas State University
San Marcos, Texas*

Umbrella time

I am an IBM employee, but I want to take issue—as a person—with your Forum of July on the "IBM Problem."

Gerald Larsen maintains, it appears, that innovation in the U.S. computer industry lags because of IBM dominance and that foreign manufacturers will take over because of this. Contrariwise, he seems to think that emulation and file structure transparency are deadly evils, and that the demise of assembly language programming is to be mourned. He blames the aforementioned on IBM and goes on to criticize U.S. standards, in particular, COBOL. (I agree that COBOL is a somewhat lousy language.)

But then he makes three recommendations for correcting what he takes to be IBM's misdemeanors—and they are sheer feather-bedding: 1) Mount a Congressional investigation; beef up the Justice department staff; fund an industry advisory committee "staffed with a wide variety of computer industry technical, marketing, and management executives." (Is Mr. L. looking for a job?)

Larsen says that "dozens of smaller competitors have gone bankrupt." He fails to note that more than dozens of small businesses go bankrupt every year and that IBM has sheltered more

than dozens of smaller competitors under the infamous umbrella. Neither he, nor Richard Sprague, in the companion article, pays any recognition to the fact that IBM has given a free ride to everyone in the business by absorbing the costs and risks of developing software first.

What makes anyone think that a baker's dozen of small companies would supply better service, be more innovative, or compete better with Yamaha than IBM?

SALLY F. DENNIS
Yorktown Heights, New York

Relative Uselessness

I read with interest your article on edp people in the June issue (p. 65). I have no quarrel with the main article's characterization of computerman, although I think it is a bit naive to assume that you can categorize computer people any better than people in any other profession.

I do object, however, to several statements made in the inset article on p. 68 entitled "tomorrow's jobs . . . how will they differ?" I do not know who the "wise men" that you interviewed are; but if Jim Emery and Dan Cougar are representative, then I submit that you have a very poor and biased sample. Did you interview any educators from departments of computer science or electrical engineering? If so, I am sure you would not have printed the ridiculous statement about "the relative uselessness of departments of computer science . . . and the people they are turning out."

Is it your belief that the graduates of business schools will design, maintain, and implement operating systems? maintain time-sharing services? develop management information systems? develop models for applications of the computer to complex societal problems? develop discrete and continuous simulation models? If so, you are grossly naive about the capabilities of graduates of business schools. If computer science departments are so useless, why are the graduates from these programs in such demand? Are companies like IBM, CDC, GE, Xerox, Bell Telephone, and TRW Systems hiring these graduates for window dressing? Some of the salaries received by our Purdue graduates this year are embarrassingly high for useless people.

The truth is that industry and business require computer professionals with varied backgrounds. The business school graduate with an edp background is one type; the computer science graduate is a different type. Each has its role to play in helping to make computers a positive contribution to our society. Your article does a disservice to all those dedicated educators in

A PROVEN, INTEGRATED ACCOUNTING AND FINANCIAL MANAGEMENT SYSTEM...

... modular in composition . . . integrated in operation . . . gives you one input, one pass data processing . . . with multiple record generation from single data entry . . . allows you or your clients to start with one or more of these modular subsystems;

- Accounts Payable
- Invoicing and Accounts Receivable
- Payroll and Labor Distribution
- General Accounting
- Inventory Management
- Fixed Assets

. . . and expand as you need to into Job Cost Accounting, Program Planning—Financial Projections, and other custom designed features.

It would cost you a lot of money and a lot of time to do it yourself. We can give it to you now . . . for less than 25% of what it would cost you to do it yourself . . . and have the system up and operating, with your personnel trained, in 30 days.

Management Control System . . . designed for IBM 360/30/40/50, Univac 9400, Burroughs 3500, and Honeywell 200 series equipment.

It has to be worth 30 minutes of your time to find out how you can put this proven system to work for your company . . . quickly . . . economically. Just return the coupon and we'll get in touch with you for an appointment. Or call collect today to: Gordon Teter (614) 267-6351.

computer science who have labored for years to provide a product that has in fact been enthusiastically received by industry.

S. D. CONTE
*Chairman, Department of
Computer Sciences
Purdue University
Lafayette, Indiana*

Mr. Forest replies: Our statements about the usefulness of computer science departments were not based on interviews with academicians of any sort, but on interviews with users, high-level technical management, industry observers—and they reflect the judgment being made in the real world of the user. Business school graduates will not mess with operating systems, but they will be designing management information and other complex systems, hopefully with the help of high-level technicians of the sort you are evidently turning out. But most of your graduates will probably work for system manufacturers or users large enough and sophisticated enough to develop or modify and maintain their own systems software and perhaps even their own hardware. The prices being paid your graduates have little or nothing to do with their immediate usefulness to an employer. Remember, too, that the major focal point of our article was the computer user. Believe me when I tell you they have very little regard for the products of the typical computer science curriculum. In any case, none of the remarks applies to any specific group, such as that at Purdue.

Discriminating

Recognizing my total deafness since birth and my edp involvement since 1966 upon graduation from Gallaudet College in D.C., I have read with great interest your July article on "Sound Waves from the Deaf" (p. 97). Interested readers are referred to the May 1, 1971, issue on the similar subject.

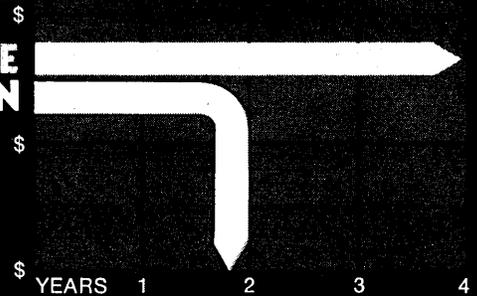

Although this handicap does not affect the work to which the deaf edp persons (far less than 1% of total edp people) are currently assigned (e.g., programming, systems analysis, technical design, et al), it is unfortunate that some firms, large or small, still are letting the deafness distort their reasoning negatively when considering well-qualified deaf edp applicants. Since the deafness is a valuable asset in this field, discriminations against us must die.

PAUL LEVENSON

The buckpassing stops here:

**IBM MONTHLY LEASE
WYLE PURCHASE PLAN**

A 16 terminal IBM 2260 CRT system leases for about \$2500 a month—from here to eternity.

If this same amount was used to lease/purchase a Wyle 8000 system, the buck passing would stop in less than two years!

How much can you save? This chart will give you an idea.

Number Of Terminals	Approximate Annual Saving After Payoff
16	\$ 30,000
32	\$ 60,000
64	\$120,000
128	\$240,000

Regardless of whether you buy or lease your Wyle system, you'll begin saving money from day one.

Wyle's 8000 is plug-to-plug & software compatible with IBM 360/370 systems. With more features for less dollars.

Such as 1920, 960 or 480 character screen capacity, up to 9600 bps data rate, non-destructive cursor, colon-seeking tab, special editing keys, character address, format protect, repeat key. Plus options including; columnar tab, lower case, function keys, numeric pad, hard copy printer and built-in data set.

So far, so good. A better product at a lower price. But what about experience? Financial responsibility? National sales & service?

Fact: Wyle has been building CRT terminals for reservations and ticketing since 1967, including a \$2.5

million contract to supply 1150 terminals for New York City's off-track-betting system.

Fact: Our parent company, Wyle Laboratories, has annual sales of over \$90 million and assets in excess of \$60 million.

Fact: Nationwide sales is provided by GENESIS ONE, one of the country's largest and most experienced computer marketing organizations with offices in 40 major cities. Also nation wide service for full customer support.

So get the whole story of the Wyle 8000. Write for our brochure. Or better yet, phone the GENESIS ONE office nearest you.

Is waiting for the 3270 costing you money? There is an alternative.

Only Courier can give you 3270 performance and features with 2260 compatibility *now*.

That's plug-to-plug compatibility. No software changes. Remote or local. Or dial-up. Choice of 480, 960, or 1920 screen sizes. Fastest response time in the industry.

Courier is replacing 2260's and 2265's (and others) with Executerm terminals and saving some well-known companies a lot of money. You could be next. A few minutes of your time is all it will cost you to find out.

And isn't it nice to know you have a choice.

CONSIDER THE ALTERNATIVE:

DATA 100 Model 78, Model 70, and Model 88-23 Terminals are at work right now saving users money and speeding up data communications in talking with 360's, 370's, 6600's, 1108, and Spectras throughout the world. DATA 100, the leading supplier of plug-in replacement Batch Terminals, offers the following products:

Model 70 Remote Batch Terminal truly plug-compatible with 2780 featuring—

- Faster throughput on lines up to 9600 BPS.
- Selection of following peripherals: 300 & 600 CPM card readers, 300, 400, 600 LPM line printers, card punch.
- 15% to 30% savings in monthly rental.

Model 78 Programmed Batch Terminal, plug compatible with 360/20 featuring—

- Simulation of 2780, 1004, DCT 2000, and 200 UT Terminals.
- All Model 70 peripherals plus magnetic tape, paper tape, CRT's and TTY's.
- Capability to concentrate data input from low speed terminals for high speed transmission to central computer.
- 30% to 50% savings in monthly rentals.
- Interleaving data transmission.
- Magnetic tape applications to fit your requirements.

Compat Model 88-23 family of Data Entry Terminals that—

- Validate input data at source and transmit directly to 360/370 central computer.
- Offers optional central off-line pooling of remote data entry terminals, thus freeing CPU of communications processing.
- Offers application software for order processing, billing, inventory control, and many others.

Find out today what DATA 100 can do for you to help solve your data communications problems with quality products, on-time delivery, and competitive pricing—all backed up with an established sales and service organization.

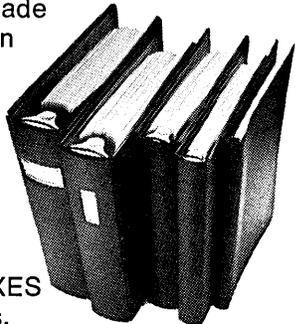

THE SEVENTY SERIES

ASK ABOUT OUR LATEST ADDITION
COMPAT 88-23

In business, records are made to last. So are Boorum & Pease products. Since 1842, our products have been holding business records, helping companies everywhere to keep things straight. In order to meet your needs, we've kept ahead of the game. Developed and delivered the kind of information storage and retrieval products that have made us leaders in the field.

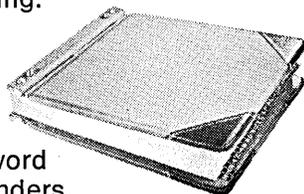

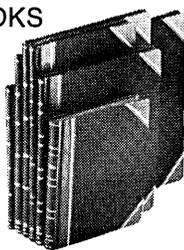

RING BOOKS, SHEETS AND INDEXES
Best sellers.

These long lasting ring books come in stiff and flexible cover styles, all standard sizes and capacities. With slide lock or booster mechanisms for safe, secure locking. No Tear® and Mylar reinforced ring book sheets are made for everyday use and abuse. All sizes and rulings available. Indexes offer six variations of tabs, including A to Z and insertables.

COLUMNAR BOOKS

They're bound to please, and last. Handsome black leather covers, with red corners. Single or double page forms. From 2 to 36 columns in every standard ruling. Numbered lines and columns for quick reference. Lithographed on high quality white paper to ensure excellent writing, easy erasing.

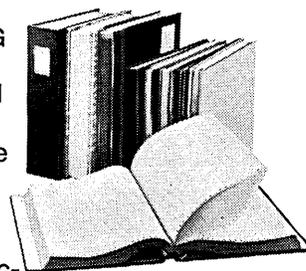

POST BINDERS

The last word in post binders. A wide variety of sizes and styles for an infinite variety of accounting needs. Durable covers made of fabrihide and canvas. Your choice of "Bull-Dog" button, "Slide Top" and "End Key" locking mechanisms. Plus all types of ledger and columnar sheets and indexes.

DATA PROCESSING BINDERS

You might call them spell binders. These durably designed nylon post binders hold data processing forms, burst and unburst. Keep them neat and easily accessible. Over 300 sizes and styles to choose from.

These are just a few of the products which have made us world record holders. Quality products backed by experience. New products for new needs. Boorum & Pease has got what it takes to serve you best. See your office products dealer or write us for more information. Boorum & Pease, 84 Hudson Avenue, Brooklyn, N.Y. 11201. Tel. (212) 875-8818.

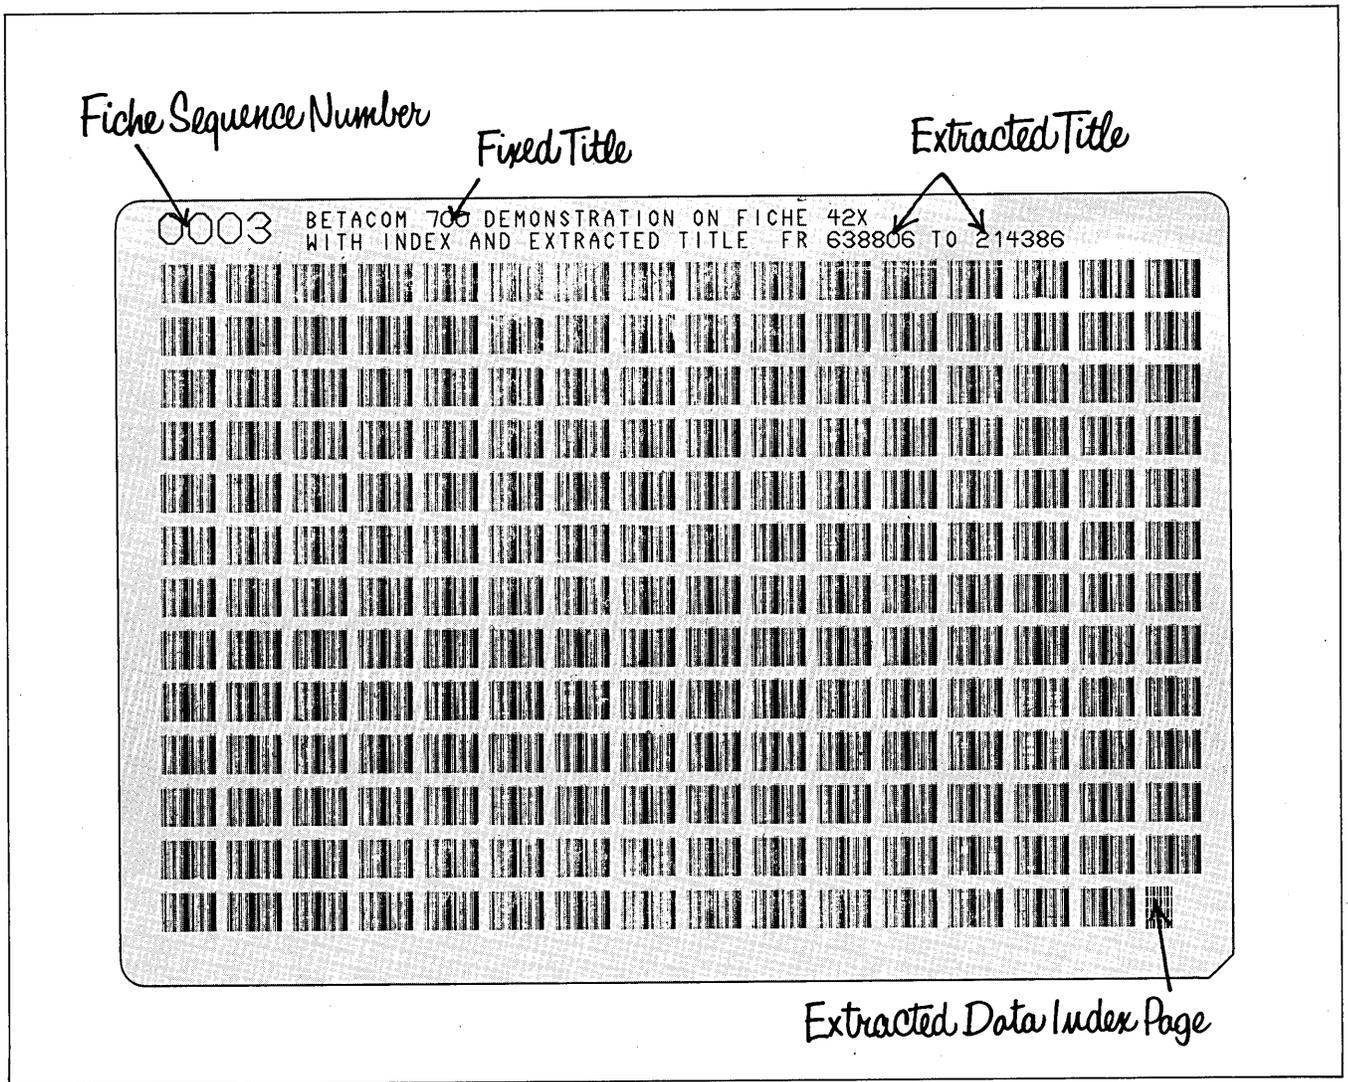

Standard

BOORUM & PEASE COMPANY

Everything you need to keep the record straight.

We hold many world records.

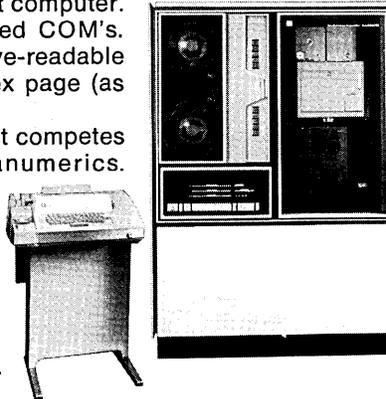

Only Beta COM gives you microfiche without reformatting

The programmable Beta COM 700L Computer Output Microfilmer formats microfiche directly from a print tape. There's no need to reprogram your host computer. And the cost competes with hardwired COM's. Output is a fully formatted fiche with eye-readable titles, "From-to" heading and an index page (as shown above).

Graphics too, if you like. And the cost competes with systems that only offer alphanumeric. Optional Beta software allows you to convert computer-generated data into graphs, tables, charts, etc. complete with labeled axes. Another thing: we price hardware and software separately. So you only get what you need. And you only pay for what you get. What's more, you can have your

microfilm any way you want it: 16 and 35 roll film or 105mm microfiche.

So if you are printing hundreds of thousands of frames per month and you don't want to reformat your data for COM, write for complete details. You'll be amazed at the reduced costs, better quality and more versatile output.

Beta COM. From the Datahandlers of Gould. Also ask us about one of the fastest electrostatic printers around that delivers alphanumerics and graphics. And advanced concepts in key-to-tape Data Entry Systems. Gould Inc., Data Systems Division, Marketing Headquarters, P.O. Box 7255, Park Hill Station, Denver, Colorado 80207.

DATA HANDLING SYSTEMS

Just Saying You're the Best is Old Hat

...Unless you can prove it.

A remote time-share plotter should be low-cost, fast and accurate. Only Zeta is all three.

Consider *speed*... The desktop Zeta 230 delivers up to 405 steps per second. Fastest of its kind anywhere. And our big 3600? 810 steps per second remote.

Consider *cost*... We offer low initial cost and *far* lower operating cost. Because we designed in speed, system throughput is faster. This means less remote line time, fewer man-hours.

Consider *accuracy*... all Zeta plotters are digital and incremental, eliminating the inaccuracies often introduced by digital to analog conversion.

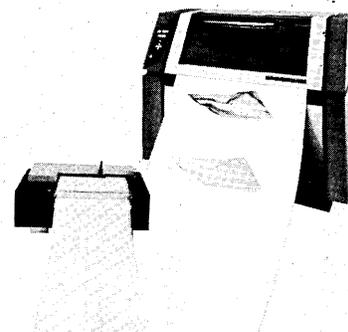

Now add full software support, an entire range of on-line/off-line plotters, and a complete array of interfaces. It's saying a lot...

So make us prove it.

Zeta Research

1043 Stuart Street, Lafayette, CA 94549 (415) 284-5200

Introducing:

From the men than anyone else in

Solid. Webster's Unabridged contains a definition of the word that reads, "of good and substantial quality...". It is in this simple and straightforward sense that we have used the word "solid" to describe our new compatible processor storage for the System 370/155 and 165.

Solid source. We're one of the world's largest independent manufacturers of memories. Our customers include virtually all of the main frame computer manufacturers. We've supplied some of the largest and most reliable memory systems ever built—for commercial applications as well as for satisfying such stringent requirements as those of the Apollo programs.

Solid technology. We are deeply involved in both core memory and semiconductor technologies. This involvement gives us the objectivity and understanding to select the technology which best provides the user with the lowest price/performance ratio. And we have solid experience with our Caelus line of disc pack memories—for both Systems 360 and 370—installed in more than 2,000 data processing centers.

Solid design. Our new 370 memories utilize the most modern type of memory module—a complete all-on-one-card memory system made with our very smallest production core—18 mil. This design gives us superior reliability as well as a physical size advantage and permits us to deliver to the user a memory that is completely compatible with the unit it replaces.

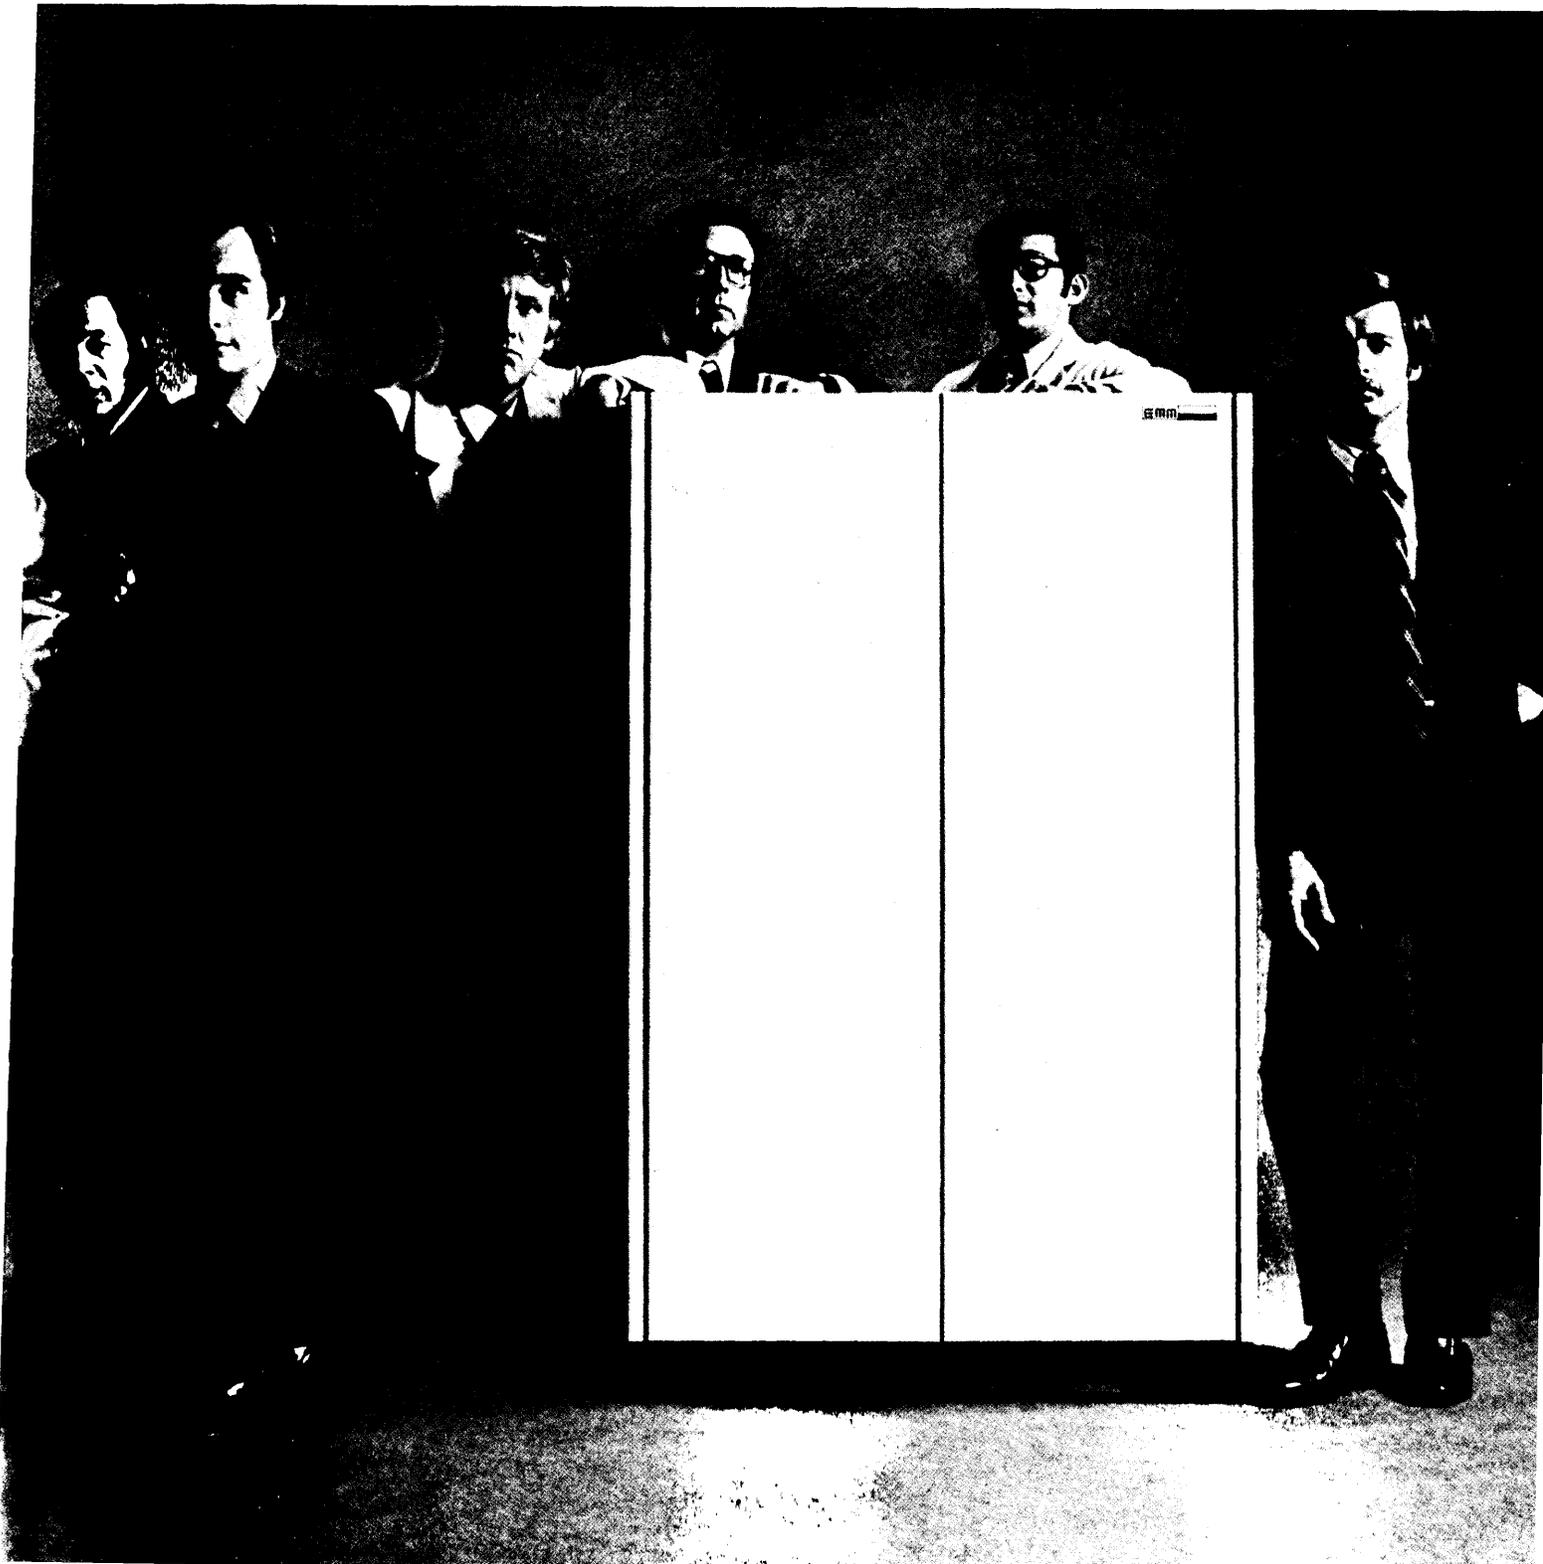

Computer memories are our business. To us, it's a mighty big business. When we bring out a new product, we risk our entire reputation in this industry. And we don't do that lightly. That's why we sometimes take a little longer than some other companies who sub-contract their design and manufacture. That's why when we deliver our memories, we know they're the best. And that's what you will always get from Electronic Memories & Magnetics Corporation.

electronic memories & magnetics

**with more experience
the memory business.**

Micromemories 3650/155

and 165 are compatible core memories for System 370/155 and 165 computers. The 3650/155 comes in three capacity sizes—262,144, 393,216 and 524,288 bytes—all completely compatible with and functionally equivalent to the IBM 3360, Models 1, 2 and 3 respectively. The 3650/165 comes in two capacity sizes—262,144 and 524,288 bytes—compatible with and

functionally equivalent to Models 4 and 5 of the IBM 3360. All versions are based on the highly successful Micromemory 3650 product which is in mass production for several computer manufacturers. Physical dimensions of the 512K byte module are shown below. Modules originally installed as 256K byte units can be easily expanded to 512K bytes in the field.

TECHNICAL SPECIFICATIONS

Storage Element:	18-mil extended temperature range ferrite memory core
Memory System Type:	Coincident current (3 wire, 3D)
Cycle Time:	2.1 microseconds (3650/155) 2.0 microseconds (3650/165)
Interleaving:	None (3650/155) 4-way (3650/165)
Operating Temperature Range:	+59°F to +95°F
Operating Humidity Range:	Up to 95% RH excluding condensation
Power Input:	208/230 V \pm 10%, 47-64 Hz, 3-phase, 4 wire
Heat Dissipation:	4250 BTU per hour (256K bytes) 7750 BTU per hour (512K bytes)
Operating Altitude:	-1000 ft. to +10,000 ft. msl
Dimensions:	60.0" high, 38.3" wide, 31.6" deep for up to 512K bytes
Weight:	870 pounds

Electronic Memories & Magnetics Corporation

Today mini users need faster and larger memories. For the first time, DIVA now offers the 2311, 2314, and 3330 type discs for minis.

Your mini can be from the DEC, Data General, or Interdata families, including the DCC-116 and the GE PAC 3010/2. The disc drives can range through the entire size spectrum. They can be mini – the Floppy Disc, small – 2310/5440, intermediate – 2311, large – 2314 (including dual spindles and double densities!), or they can be the largest – the 3330. DIVA's controllers can integrate any combination for you.

Does your application need disc compatibility between a mini system and a 360 or 370? How much would it be worth to be able to pre-process data on your mini's disc packs and then transfer the packs to a 360 or 370 without worrying about disc format changes or DOS compatibility?

If you only need a controller, DIVA will provide it. If you need the mini and the controller, DIVA will provide them. If you need the complete system of mini, discs, and controller, DIVA will provide it. Standard items include complete I/O driver software, diagnostic software, and hardware as necessary.

Call or write Dave Britton at DIVA to find out just how far DIVA can stretch your mini's memory and meet all of your requirements for fast, large, and low cost disc controllers – or complete systems.

Five times the capacity of the 2310! Twice the speed! The same price! This is the DD-14, DIVA's newest total disc system.

The DD-14 has a capacity of 29 million bytes, a transfer rate of 312,000 bytes per second, and an average access time of 35 milliseconds. It offers mini users – with mini budgets – the opportunity to break away from the 2310 and upgrade their disc systems by an order of magnitude. The price is \$12,500.

This concept is frankly revolutionary. There is nothing available today in its price/performance class for the mini user who must increase memory size without increasing total system cost. The DD-14 has the same total disc compatibility with all minis that exists within the disc systems of the 360.

Worldwide field support is provided to all DD-14 users through IBM qualified service centers.

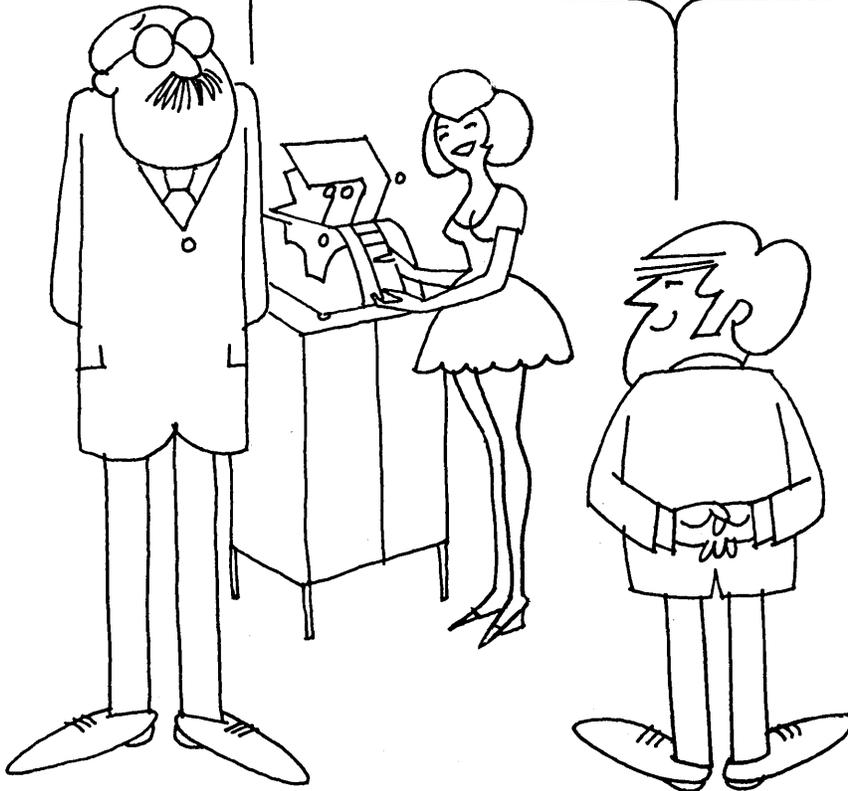

DIVA INC.
58 Maple Ave., Red Bank, N.J. 07701
(201) 842-6500

Industry's Source for Disc Controllers

I'm glad we found a bar code our people can understand.

Yep, I'd hate to replace a valued employee like Miss Jones. Thanks Monarch. (for Codabar)

Anyone with a smattering of experience in marking merchandise performs like a pro with Monarch's CODABAR code. It's that simple. And reliable . . . prevents errors in marking and reading that cost you money.

And Monarch provides other products to permit you to use the code at amazingly low cost: a versatile printer (none easier to operate); a full line of Monarch-quality tags and labels: a choice of proven attachers;

a light pen scanner that refuses to read errors; and an ingenious batch reader (coming soon) that wraps up your day. CODABAR and Monarch's related products make everybody look good. Especially you. They're currently in use with Pitney Bowes-Alpex SPICE™/PEPPER™ Systems.

Mail the coupon for a special Fact Pack on CODABAR . . . from the world leader in merchandise identification and control systems. Monarch!

CIRCLE 49 ON READER CARD

The storage space doubles. The cost doesn't.

Dual Density from CalComp:

If you store your information on disks, the time comes when the storage system you started with isn't big enough any more.

If you're using an IBM 2314, *their* next step up is a 3330. And maybe even a new computer. But *you* may want to talk to CalComp.

The most realistic step up from an IBM 2314 is a CalComp 1015 Dual Density Disk System.

With it, you double your capacity for only 40% more cost. And you can grow out of

your old storage system without growing out of your old storage room.

The floor space remains the same. So do the disk packs.

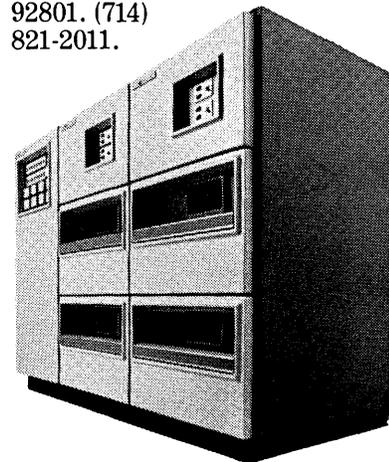

The programming even stays the same.

Naturally the CalComp 1015 is compatible with IBM System 360 and 370 computers.

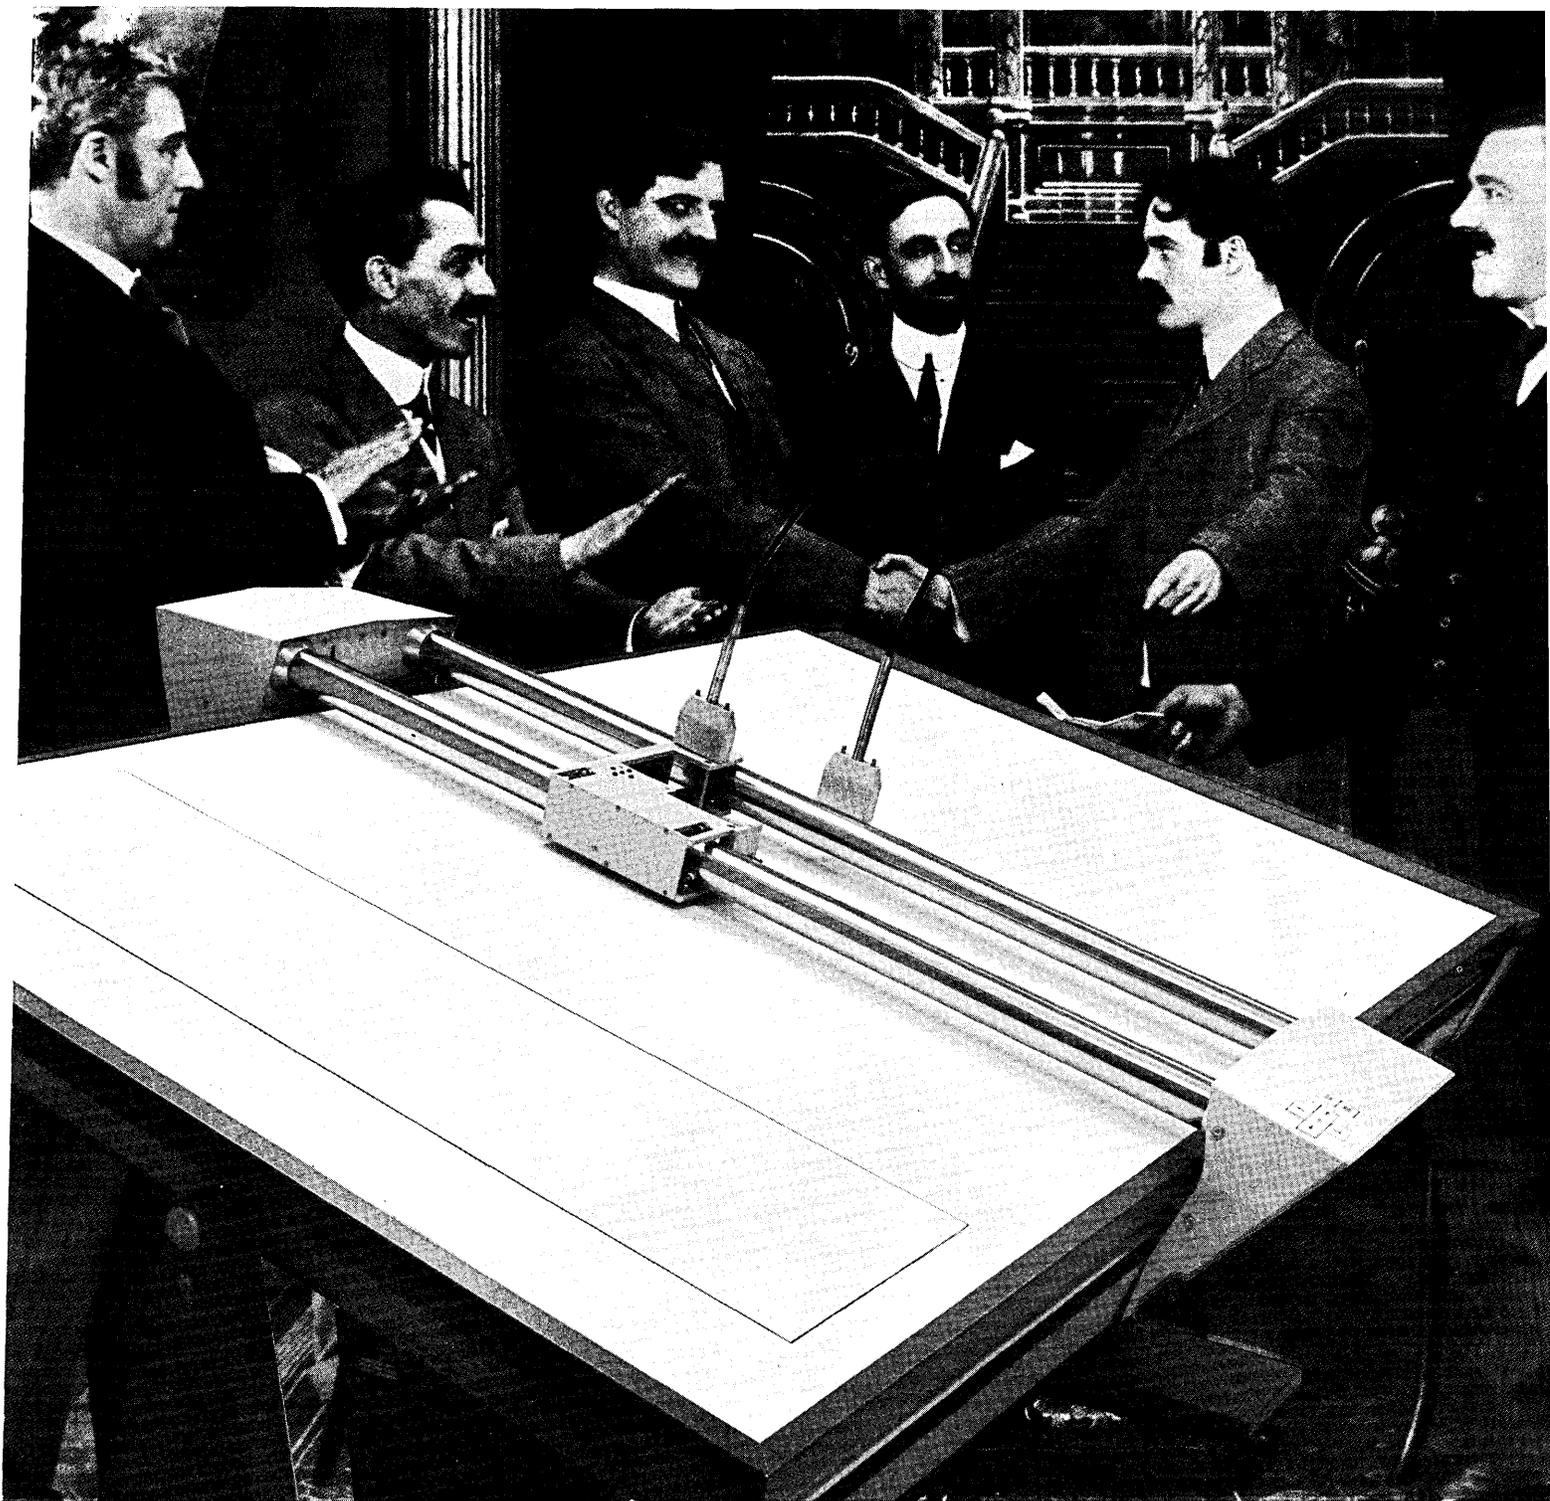

Next time you look around your computer room, and you wonder where to put all the new storage you need, think of CalComp.

Remember, one small step for your business doesn't have to be one giant leap for IBM.

Call your local CalComp office, or contact California Computer Products, Inc., DM-M9-72, 2411 West La Palma Avenue, Anaheim, California 92801. (714) 821-2011.

THOSE MAGNIFICENT YOUNG MEN AND THEIR DRAFTING MACHINE

Time was when a plotter that could make complex shapes and finished drawings from a mathematical description seemed to be the ultimate in state-of-the-art advancements.

That was yesterday.

Now, with an Auto-Trol plotter serving as an extension of the draftsman, designer, engineer or scientist they can routinely generate isometric and trimetric drawings, including vanishing point perspectives, rotate the figure around an axis, scale down or blowup a drawing and produce mirror image or reverse drawings. Once a symbol, circuit, shape or compon-

CIRCLE 12 ON READER CARD

ent has been put into memory, it can be reproduced anywhere in the drawing as many times as necessary on command. Drawings can be produced 20 times faster than with raw manpower, and they are virtually perfect every time. But, we aren't limited to drafting. The Auto-Trol plotter can plot contours, verify N/C tapes, cut strip film and serve as a working partner in computer aided design. Auto-Trol systems are modular so you can start small and expand at an economical pace.

People such as General Motors, Union Oil, Bell Labs, Motorola, U.S. Navy, Calif.

Denver, New Jersey, Atlanta, Los Angeles, San Francisco, Paris (EAC International)

Highway Department, U.S. Geological Survey and hundreds of others are doing it better and faster with Auto-Trol systems. Let us help you be magnificent. Call or write for complete details.

A SUBSIDIARY OF

EMR Computer's Mission-Matched computer systems are successfully automating chemical plants... biomedical laboratories... chemistry and physics laboratories... manufacturing plants... and major vehicle test facilities.

Our new 6145 computer does even more! It readily performs data acquisition and analysis, information management, and laboratory or production monitoring and control... all at the same time.

EMR Computer offers a wide spectrum of data acquisition and control solutions, so you can solve your problems one step at a time. For example, you can start with a 6135

computer with as little as 8K of core... add memory as you need it... and grow into the new 6145 with up to 128K of core — with few or no modifications to existing programs.

We know that your problems are dynamic and changing. That's why we design flexible hardware and software so you can add and debug new applications while the computer system is on-line.

EMR Computer has a unique story to tell! For detailed information on a Mission-Matched system for *your* application, call or write: Director of Marketing, EMR Computer, 8001 Bloomington Freeway, Minneapolis, Minnesota 55420. Tel: (612) 888-9581.

BUY YOUR MINICOMPUTERS FROM DATA

Just buy some Nova-line minicomputers and peripherals, at OEM discounts as high as 40%.

In the bargain, you get the benefit of all the hardware and software development that these guys (and a lot of others) have done in the last four years.

And that can save you a lot of time, money and trouble.

If you're an OEM designing systems, you want to concentrate on your job.

You don't want to waste time building special interfaces and writing software that should have come with the minicomputer.

That can eat up everything you saved on the minicomputer! There's a better way: buy

your minicomputers from Data General.

They come with a lot of free software — much of it written by some of the guys in the picture — that's been proven in over 3,500 minicomputer systems all over the world.

It includes assemblers, editors, debuggers, diagnostics,

GENERAL AND GET THESE GUYS FREE.

math routines, Extended FORTRAN IV, Extended ALGOL, Extended Timesharing BASIC, Real Time Disc Operating System (RDOS), and Real Time Operating System (RTOS). You get everything that runs on your hardware.

And it's all free.

Then we've got the periph-

erals you need: our new fixed-head Novadisc, cartridge discs, moving-head discs, mag tape drives, teletypewriters, CRTs, A/D and D/A, line printers, plotters, card equipment, paper tape equipment, communications interfaces.

Every device comes interfaced and ready to operate.

It would cost a fortune to buy the software and hardware development we've already done.

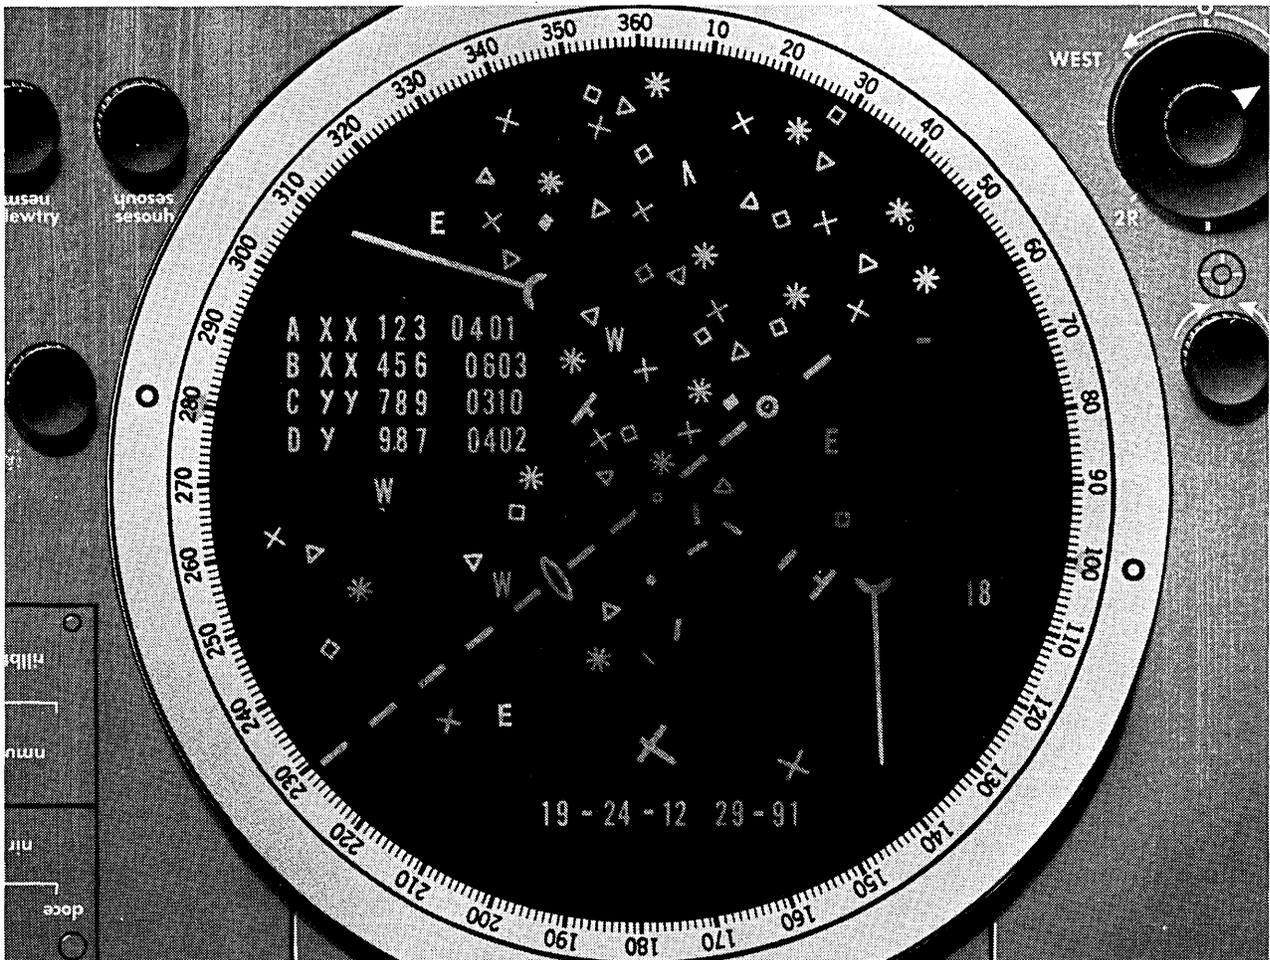

Or, you can get it all from us free.

Just contact any Data General salesman.

He comes free, too.

Even where standards
have been long established,
nonconformance seems to be the rule

Flowchart Packages and the

Tempers run high and conversations become heated on the topic of flowchart packages and the American National Standards Institute (ANSI) X3.5-1970 Flowchart Standard.¹ The creators and vendors of these software packages generally give the impression of being on the side of motherhood, the flag, and God, and that they are observing the Standard as far as practicable. Or alternatively, they deny that the ANSI Standard has any significance; it is what IBM does that counts, some of their personnel have told me.

On the user side, each installation has its own idiosyncrasies. Anything offered by a vendor that does not match these, the users in my observation decry as "nonstandard." Further, the users generally defend their practices as conforming to the ANSI Standard, or if they do not, claim them as improvements upon it, or as adaptations of it to their unique conditions, or as what their computer vendor recommended, or as common practice.

Clearing the air

In an attempt to reduce contention and to clear the air, I report here on an attempt to measure objectively and quantitatively the extent to which the output produced by a representative selection of flowchart packages conforms to the ANSI X3.5 Standard. Then I offer some reflections in a positive vein on the problems that impede improved conformance.

Background

To make the study reported here, I solicited the assistance of a number of vendors of flowchart packages. My object was to sample widely from among the packages that are the most popular and widely used for flowcharting COBOL programs. Some of the vendors elected not to participate; the participating vendors and packages are cited in Fig. 1. To help distinguish the packages, the vendor name has been prefixed. The name AUTODOC was first used by F. David Lewis. The WCC-FCP package was almost identical in output to the LOGIGRAM package from CTSS.

All of the packages except the Lewis-AUTODOC-V were run against the same five COBOL source programs. One each of these programs was contributed by the participating vendors, except for F. David Lewis. To assure getting a "best foot forward" run, each vendor made the runs at its own installation using its own personnel.

All of the packages can produce more than just flowcharts. Their vendors like to tout them as documentation packages for this reason. Indeed, their output can serve as a significant part of program documentation. But as pointed out elsewhere they do not and cannot at the present provide all the necessary elements needed to comprise program documentation.² Further, in this paper, the attention focuses on the flowchart output they produce. For this reason the packages are referred to here as "flowchart packages."

All of the packages produce flowchart output of the flow diagram type, not the systems chart type.³ That is, the flowcharts these packages produce provide a graphic statement of the algorithm used in the program. They do not show the place of the program in the overall system or the relationship of the program to the rest of the system of which a program may be a part. For this reason, some parts of the ANSI X3.5 Standard are inapplicable to the flowcharts produced by the packages. No comparison therefore was made and no reflection should be inferred on those parts of the Standard not specifically discussed in the comparison that follows.

Shape and ratio

The ANSI X3.5 Standard outlines needed for flow diagrams are summarized in Fig. 2 (pages 50-51), along with the shapes and ratios observed for these outlines in the output from the packages.

The ANSI Standard specifies a shape and a width-to-height ratio for each outline, except the flowline. Shape and ratio specifications have been a part of the Standard since its inception in 1963. They were also retained in the 1970 revision which brought the ANSI Standard into close agreement with the International Standard (ISO).

The shape and width-to-height ratios were measured for each of the outline types for each vendor not once but many times, to see whether or not con-

3. Background information and directions for producing flowcharts can be found in Ned Chapin, *Flowcharts* (Princeton, N.J.: Auerbach Publishers, Inc., 1971), 179 pp.

ANSI Standard

by Ned Chapin

sistency was present. As can be seen from Fig. 2, the shape was well maintained but the ratios often varied dramatically.

When drawing flowcharts with a computer's line printer, one must live with the restriction of eight lines to the inch vertically and ten characters to the inch horizontally. Because of these restrictions, the shape and ratio requirements cannot be met exactly. But this is no justification for the very wide deviations from the ratio requirement observed, or for some of the shape deviations noted.

As can be inferred from Fig. 2, the common practice is to make the width of the outline a constant, given the type of outline, and then to vary the height to fit the amount of text to be written within the outline. In other words, the vendors have ignored the Standard's permission to use outlines of varying size as long as the ratio be maintained. Two near-trivial exceptions are the DIC-AUTODOC and the NCA-QUICK-DRAW as noted below.

A violation of the ANSI Standard was

noted in the input-output outline. Rectangles, as used by the APC-DYNACHART and the NCA-QUICK-DRAW, are specifically not permitted for that purpose by the ANSI Standard since both the input-output outline and the rectangular process outline are among the basic outlines. The use of a trapezoid with the base smaller than the top (a "keystone") was permitted in a previous version of the Standard.

Process outlines also violated the ratio requirement. No shape violations were noted for process outlines or for flowlines. But the later discussion of direction of flow should be noted.

The annotation outline was another story. Not one of the packages presented annotation in a conforming manner. As can be seen from Fig. 2, the violations were major.

The connector outline was often a violation, since the shapes provided often deviated from the circle specified by the ANSI Standard. The terminal outline also was characterized by diversity and nonconformance to the Standard. The terminal and connector

outlines have a clearly specified use in the Standard; the packages did use some in those ways. But the packages also used nonconforming shapes. Alternatively, they substituted other outlines for situations where the terminal and connector outlines would have been appropriate, or they did not use them at all.

Among the specialized outlines, the picture was a little brighter. The decision outline was the diamond with one exception: the APC-DYNACHART used a rectangle with rounded corners—a clear violation. In order to accommodate long wordings, the DIC-AUTODOC and NCA-QUICK-DRAW provided three distinct sizes of decision outlines, each of which individually conforms but modestly to the ratio requirement. To accommodate long wording the DIC-AUTODOC drops the bottom out of the diamonds, filling the voids thus made with a column of print—a clear violation of the Standard.

The preparation outline was not part of the earlier versions of the ANSI Standard. This may account for why some

Flowchart Packages . . .

of the packages do not use it. The predefined process outline has been changed in function with the different versions of the Standard. The ADR-AUTOFLOW, DIC-AUTODOC, and the NCA-QUICK-DRAW were capable of producing the vertically striped rectangle form. The use they assigned it in COBOL was for representing the PERFORM statement. Using the more modern versions of the Standard, these should have been presented in a horizontally striped outline, not in the vertically striped rectangle. The Lewis-AUTODOC-V and the ADR-AUTOFLOW provided horizontally striped outlines. The Lewis-AUTODOC-V used them for subroutine calls generally, but did not provide the cross referencing called for in the ANSI Standard. The ADR-AUTOFLOW used horizontally striped outlines for decision functions—a clear violation of the Standard.

Five examples of nonconforming outline shapes were noted. One already cited was for annotation. Another observed only in the APC-DYNACHART was the use of a dumbbell like a pair of connector circles placed astraddle the flowline, for calling attention to the succeeding outline as specifying an ALTER operation, shown in a rectangle (a preparation outline would have been conforming).

The third example was the use of a rectangle with a pointed right end for program modification ("preparation") in the Lewis-AUTODOC-V and the DIC-AUTODOC. This is a usage taken over from IBM's former practice. The fourth was the use of rectangles for GO TO statements in the DIC-AUTODOC. This in effect resulted in successive connectors in the line of flow. Fifth was the use of horizontal striping in the ADR-AUTOFLOW for switch functions. The Standard provides a choice of specific shapes and conventions for this purpose, and assigns horizontal striping a different function.

Cross references

The packages showed much diversity in their use of cross references. Both the ANSI and ISO practices are observed in the examples included.

Sequence numbers assigned to the source code are at the heart of the way all of the packages provide for cross references except the Lewis-AUTODOC-V, which uses a grid arrangement. Also for cross reference, the packages show the COBOL paragraph and section names on the flowchart. But they display no consistency on this matter. The ANSI Standard does not distinguish source code sequence numbers from source code names. Yet both cannot

occupy the same space in the flowchart. Using both, as all the packages except the Lewis-AUTODOC-V do, therefore results usually in a violation of the Standard, and a diversity of practices displayed by the packages.

The ANSI Standard for some years has specified that cross referencing by flowchart location is to be done for striped outlines. In practice this convention was not observed by the packages in the manner specified by the Standard.

Striping

Some observations on striping have been reported previously in this paper. The use of horizontal and vertical striping is not new in the ANSI Standard, yet none of the packages produced flowcharts conforming to the Standard on striping. This, like cross referencing, was a major area of nonconformity.

Connector identification

The ANSI Standard specifies the manner of connector identification. Since connectors were used so loosely in terms of conformity with the ANSI Standard, as noted previously, the connector identification also suffered—but not as much as the use of connectors itself.

Multiple exits and parallel operations

The ANSI Standard specifies manners of representing multiple exit flow paths when the number exceeds three, and a way of representing parallel operations. In practice, with present-day computers and COBOL, these situations are rarely encountered. The five test programs did include an instance of the multiple paths. None of the packages handled it in conformance with the Standard. The test programs did not include any instances of parallel operations.

Flowlines

The Standard specifies an open arrowhead for use on flowlines, and this can be approximated on line printers. The Standard requires the use of arrowheads to indicate flow direction if it would be otherwise ambiguous, or if it deviates from the usual top to bottom and left to right. All of the packages deviated from the Standard on arrowheads.

The Standard clearly specifies a means for indicating joining flowlines, for indicating crossing flowlines that do not join, and for avoiding crossing flowlines. Some packages, such as the APC-DYNACHART and the DIC-AUTODOC, never cross flowlines. Others, such as the NCA-QUICK-DRAW, rarely cross flowlines. The ADR-AUTOFLOW and the Lewis-AUTODOC-V both often cross flowlines. But all the packages with crossing

flowlines fail to do it in the manner specified by the Standard.

The ADR-AUTOFLOW, and to a lesser extent the NCA-QUICK-DRAW, illustrate another nonconformance with the Standard. When the amount of wording to be placed within an outline exceeds some given amount, rather than use a larger size of outline or truncate the wording the package continues the wording in a subsequent outline or in an annotation outline. Since the Standard specifies a means of changing the outline size, breaking the wording across outlines becomes a violation.

It is my impression from talking with package vendor personnel, from studying the flowcharts produced by the packages, and from talking with the users, that some of the violations of the ANSI Standard arise from inertia or the blind following of prior practice. Some arise from ignorance of the Standard. Some arise from willful deliberate action. And some arise as a matter of vendor convenience. A brief look at each may clarify these comments.

An example of inertia or the blind following of historical practice is the perpetuation of outline shapes used by computer vendors. One example is the off-page connector outline used by IBM. Some of the packages, such as the ADR-AUTOFLOW, have carried this outline over into their output.

Yet the Standard provides a connector outline and provides a means of cross reference to enable the user to distinguish whether or not it is on-page or off-page. It can well be argued therefore that since the Standard has provided something for the function, the IBM off-page outline is a violation of the Standard. In addition, some of the package vendors, such as in the DIC-AUTODOC package, are able to designate by their use of the connector identification whether or not something is on-page or off-page in a manner that conforms with the Standard. (The DIC-AUTODOC's use of the IBM connector itself is redundant.)

A good example of ignorance of the Standard is, surprisingly enough, the ratio and size requirements. The ratios have been a part of the Standard since 1963. The Standard's use of ratios without tolerance ranges follows in the tradition of ratios used in other standards for graphic material as, for example, in some of the standards for electronic graphics. To accommodate different amounts of wording, and different amounts of space available, the Standard permits the use of any size of outline, as long as the ratio, shape, and general orientation of the outline is preserved.

Yet, in talking with some of the creators and maintainers of these packages in their own shops, I have

been frankly surprised at the ignorance of the Standard they show. They generally cannot answer the question "What is the ratio specified for this outline by the ANSI Standard?" nor do they have available a reference source that they can turn to. Many shops had no copy of the ANSI Standard available for use of their package writing or maintenance personnel. Often they could not cite a location in any publication they or their employer had where they could find detail on the Standard.

When the designers of the packages do not know the Standard it is difficult for them to make their packages conform to it. This ignorance of the Standard is perpetuated by the very high cost per page ANSI asks for the copies of the Standard, by the severe restrictions ANSI places upon reprinting the Standard's words or figures in a publication (you notice none in this paper for that reason), and by the failure thus far of professional associations (such as ACM, DPMA, AFIPS) and periodicals (such as DATAMATION) to require all of their authors to use the Standard.

Willful nonconformance to the Standard is not hard to find. The most common source of this comes from the discrepancies between the ANSI Standard and the practices followed by IBM in the past and currently in flowcharting. The package vendors argue that approximately 70% of the computer users (their prime market) have been exposed to and indoctrinated in the IBM way of doing things. They believe, if they wish to sell to this market, they should follow the IBM practices, irrespective of whether or not they conform to the ANSI Standard. Guesses about market acceptance are the criteria, not conformance to the Standard.

IBM's publication in 1969 of a new template (X20-8020-1), which includes as a subset the ANSI Standard outlines, would give less fuel to this argument than existed in the past—if the package vendors would revise their programs to match. However, the new IBM template provides three outlines which are not part of the ANSI Standard: keying, transmittal tape, and off-page connector. The idea of giving the package user a choice has been tried: the DIC-AUTODOC offers the user a choice of IBM practices or not, for example.

The convenience of the vendor is also an important influence affecting conformity with the ANSI Standard. One example is the use of source code sequence numbers in the flowchart. Another example is the common vendor practice of making outlines have a uniform width and variable height, and thus violate the ratio requirement. Using outlines of all one width is con-

venient for the package creator. Then he simply varies the vertical dimension to accommodate the wording he desires to put in the outline.

Is this really a significant convenience to the vendor or creator of the package? The mathematical knowledge necessary to calculate the length and width of an enclosing outline, given the ratio, is elementary and is widely known. Also, it is easy to calculate the area needed as a minimum to be enclosed within the outline, and the length of the longest line of wording, simply by parsing and counting the characters chosen to be printed within the outline. It then becomes relatively simple to calculate the outline width, center, and height, given the limitations of the printer, to approximate closely the ratio requirement. Further, it is not difficult to center the wording within the outline as is done in the ADR-AUTOFLOW, or to justify it as is done in the APC-DYNACHART.

Where then does the complication come? The complication comes in the allocation of page space. The typical package designer likes to visualize a page ruled off into a fixed number of uniform vertical columns. As long as the outline width stays within the margins of the imaginary column, no problem exists. But when the width of the outline exceeds the space provided in the imaginary column, then the outline begins to infringe upon the space for outlines in the adjoining columns. For columns on the sides of the page, this may be an absolute limit. If they are in one of the center columns, then only smaller outlines can be placed in the adjacent column, or flowlines only will have to be used to pass the bulge in the other column.

But how serious a practical problem is this? The real question arises as to how much wording is to be placed within the outline. In practice, the outlines requiring the largest amount of wording are annotation outlines, process outlines, and decision outlines—in that order. Annotation outlines should always be set to the side of a line of flow anyway, following the practice indicated by the ANSI Standard. Hence, they should be already occupying space in an adjoining column. The impact of these on the allocation of page space is direct and obvious in the common instance—and currently ignored by the vendors.

For process and decision outlines, however, the picture is far less clear, and the problem is at its worst for COBOL. Long decision wording can often be parsed to break the decision into a group of distinct separate decisions. For the process outlines, by contrast, long wording normally arises by combining in one outline more than one operation. Parsing the wording to

provide fewer operations within the outline can often have the effect of reducing the amount of wording to be accommodated in any one outline, and thus of reducing the outline size needed. It would be far more difficult to substitute shorter wording for the verbatim COBOL wording.

Conclusion

The flowcharts produced by the packages compared here generally use the shape of outlines appropriate for the operation, as indicated by the ANSI Standard, although even there some exceptions were noted. The packages also conformed well to the Standard on the direction of flow. But on most other points, nonconformance was the rule. Annotation was not in conformance, and ratio, connector, and cross reference practices were commonly not in conformance with the Standard.

Each of the packages lacked conformance with the Standard in different ways. Each of the vendors, in a desire to differentiate their packages and gain a competitive edge, may feel that producing ANSI Standard flowcharts would blur their competitive advantage. Can they best compete by nonconformance with the Standard? But is the welfare of the vendor the main issue? How about the package user? Maybe the real question is "Does the user want packages that produce flowcharts meeting the ANSI Standard?"

It now appears that an international standard for cassettes will be officially adopted

The New Cassette Standard

by William W. Otterson

Despite the paper-rattling by IBM over the last few years regarding a tape pack that—with IBM's muscle behind it—would become a *de facto* standard, the computer industry does have a new draft international standard for cassettes.

The X3B1 Committee of BEMA (Business Equipment Manufacturers Association), the computer industry's input to ANSI (American National Standards Institute), is now voting on adoption of the proposed ECMA (European Computer Manufacturers Association) Standard for Interchange of Data on Cassettes.

The new draft standard (available by writing to the author*), picks up where the old Philips standard—which covered only the outside physical dimensions of the cassette—leaves off. In addition to size, it calls out recording density (800 bpi), cyclical-redundancy-check character (CRCC), recording mode (phase encoded), 2 tracks one at a time (side A and side B), tape length 282 feet minimum, inter-record gap (minimum of 0.7 inches, maximum of 19.7 inches), and format (8 bits per character with preamble and postamble for each record).

For the cassette user—whether he plans to interchange data with someone else or not—the new draft stan-

dard offers a number of advantages in system implementation, performance, reliability and cost.

The first advantage to the user is that the new draft standard will make his choice of cassette drives easier. Instead of attempting to determine the relative merits of 550 bpi vs. 800 bpi, or one-track phase encoded recording vs. two-track NRZI recording, the user can evaluate the characteristics that relate directly to his specific application: What is the data transfer rate? Is the transport convenient to operate? How easily will it interface with my system?

With an established standard, product designers can produce cassette peripherals knowing that these will not be made obsolete by a new format.

For example, a product requested by many cassette users is a cassette-to-industry-compatible-tape converter, to permit communication with the computer center. Before the draft standard existed, the design engineer had to tailor the product to a specific manufacturer's format and thereby limit his potential market. With the standard, a general-purpose system can now be designed. With its greater market potential, its price will be lower than the semicustom product.

Other obvious products meeting these same criteria are keyboard-to-cassette encoders for entering programs onto cassette tape, off-line cassette printers for remote printing or

used to conserve cpu time, and data loggers utilizing cassettes for the output.

Design engineers will now be able to concentrate on developing products within the standard.

Instead of trying to double the density, the engineer will work to double the tape speed. Instead of trying to reduce the inter-record gap, he will work to reduce start-stop times. Instead of trying to redesign the cassette, he will work on making the transport simpler and more reliable.

The analogy to the history of the industry-compatible 1/2" tape drive is obvious. By concentrating their efforts on speed, designers of minicomputer tape decks have been able to increase speeds to 75 ips on a \$4500 tape drive—unthinkable only a few years ago. Unquestionably, cassette drives will similarly increase their tape speed from a current 24-30 ips to 48 or 64 ips.

Interchangeability

Cassette users have been plagued by a lack of interchangeability of cassettes from drive to drive, in some cases even when the drives were from a single manufacturer. The new standard assures that if its specs are met, there will be no such problems.

The pressures for low-cost cassette drives were so great when they were first used that some of the early drives were simply converted audio decks.

*C/o Cipher Data Products, 7655 Convoy Ct., San Diego, CA 92111.

Poor early reliability almost killed the cassette as a usable magnetic recording device for minicomputers, terminals, etc.

The stringent requirements of the new standard for good speed control, tracking and recording will weed out the lower quality drives on the market.

The standard also does away with the fear of getting locked into a single manufacturer or having your system made obsolete by new, noncompatible equipment.

However, present users of equipment that does not meet the new standard are faced with a dilemma if they need additional units. Should they convert now, or prolong the agony by ordering another noncompatible system? The equipment manufacturer is faced by the same problem: when should he obsolete his present line of equipment?

The shakedown to convert might take a year or so, but steps have already been taken by some manufacturers. If their equipment meets the new standard's specifications for bit-to-bit spacing, phase encoding, track position, inter-record gap, etc., the manufacturers are converting now and providing update kits to retrofit installed tape drives. (Where the equipment does not meet the stringent new requirements, there is a great deal of gnashing of teeth and redesign going on.)

Future of cassettes

Cassette drives should follow pretty much the same pattern that was established by industry-compatible 1/2" tape drives. There will be a short shakedown period, then the user will have his choice of a greater number of types of equipment from several manufacturers, all of the equipment with better performance, reliability and price than before the standard was adopted. □

SPEED PROCESSING with "ON-SITE" PUNCHING of SOURCE DATA

MODEL 2600-00

Instead of using hand written source data which must go to keypunching before entry,

you can punch source data into cards at any remote location using the Wright Punch. These cards can then go directly to data entry.

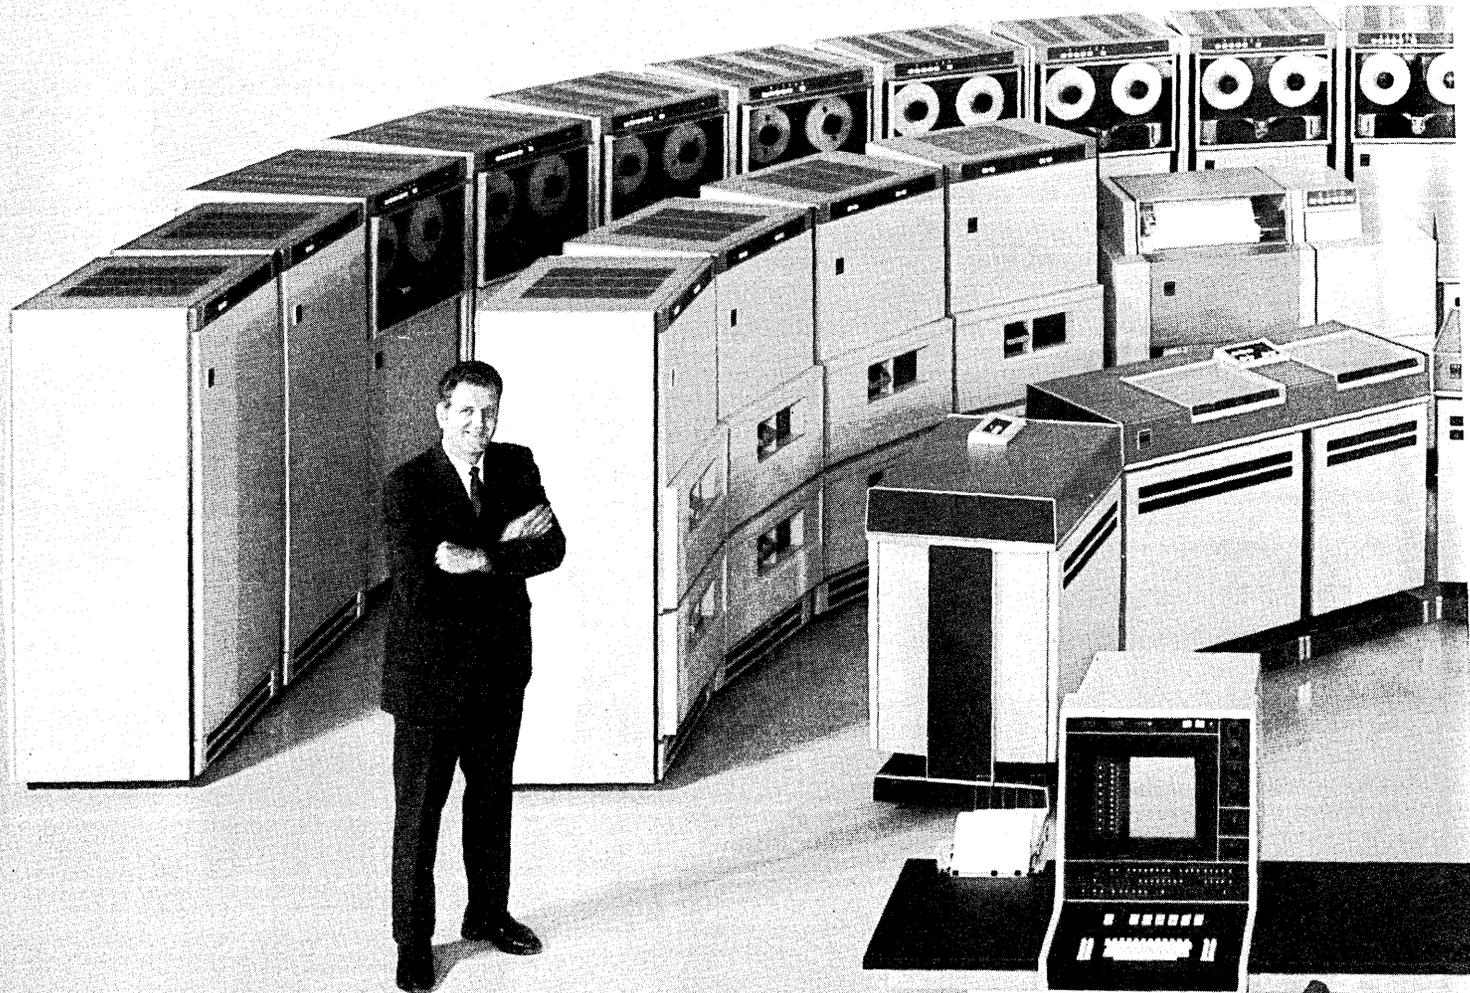

Find out how this remarkable, inexpensive yet reliable precision portable card punch can help you to speed data flow, reduce keypunch bottlenecks and save money. Circle readers service number or write to Electromechanics Department, Wright Line, A Division of Barry Wright Corporation, 160 Gold Star Boulevard, Worcester, Massachusetts 01606.

Other models available (manual and electric) for punching Hollerith type holes into plastic tabulating, credit, ID and badge cards. Special versions available. OEM and Dealer inquiries invited.

our big brother

**The NCR Century 300,
our biggest and most advanced
computer, means more power
to you, for less.**

The NCR Century 300, the "Big Brother" in the NCR Century family, is a powerful computer system. It's designed to handle big jobs for companies that need more computer power. There just aren't many information processing jobs around, scientific or commercial, too big for it to handle.

The "300's" combination of sophisticated software and powerful hardware allows big users the kind of real-time/multiprogramming throughput they can appreciate. Here's a system with plenty of power for satellite computers to draw on. And with modular peripherals and memory designed for almost unlimited expansion.

Big as it is, the NCR Century 300 provides a

better return on every dollar invested than any comparably priced system in the industry.

One reason why is reliability. The "300" utilizes the most advanced concepts in hardware and software architecture. Combined with highly efficient and proven peripheral units, the result is that system performance, processing power, and reliability surpass competitive systems. Including many higher priced systems!

Another reason is because the big "300" uses standard industry languages, with compilers, operating systems, utilities and applications software already written and tested. And in operation right now in Financial, Government, Distribution, and various other industries.

Ease of operation and control is still another reason for looking into the big "300." A combination CRT and thermal printer console provide the operator instantaneous, complete instructions. And, it allows rapid response to program requirements to insure maximum control and awareness of all on-going programs and systems.

Investigate the NCR Century 300. You'll see how you can take advantage of more power, more speed, higher reliability and unlimited expandability. For less cost than you may think!

For the specifics about "Big Brother," and how it can go to work on your biggest information jobs, call your local NCR office. Or, contact NCR EDP Products and Systems, Dayton, Ohio.

Announcing faster memory, more expensive processors, cheaper disc systems, and the death of the 370/155 and 165

IBM's Virtual Memory 370s

by R. A. McLaughlin,
Associate Editor

On August 2, 1972, IBM propelled itself into a new chapter in its history. With an announcement framed in uncharacteristically bold language, the company simultaneously redirected its product line, increased the capabilities of some of its installed products, showed off a new memory technology, killed the two-year-old 155 and 165, reduced prices, and took a strong swipe at that part of its competition that it considers parasitic.

IBM's announcement confused many. Part of the confusion stemmed from the fact that there were dozens of new products and features hidden under one cover, including: four processors (the 155 II, 165 II, the 158 and 168), a combined disc and controller (the 3333), three integrated disc controller features, and four bundled operating systems (DOS/vs, OS/vs1, OS/vs2, and VM/370).

The common denominator of all the releases was that they were designed to make virtual memory work cost effectively on the 370s.

Virtual memory is not new. It was released at least as early as the Burroughs 5000 processor in 1961, and has been used since by other computer manufacturers, including RCA and IBM itself. Basically, it gives the programmer the ability to use the real memory attached to his processor as if it were much larger than it actually is. The concept relies on a backing store, like disc subsystems, which the virtual memory operating system uses to temporarily hold those parts of a program which are not currently being executed.

The complicated part of any such memory organization is keeping track

of what part of the program is in real storage and what part is on disc. IBM does this through a feature called DAT, or Dynamic Address Translation. DAT requires some extra registers and logic. In planning ahead, IBM built most of the DAT requirements into the 370/135 and 370/145, so those machines will get the new feature free. IBM did not build the extra hardware into the 155 and 165, so converting them is quite a job (and a terrific expense on purchased machines). The new machines, the 158 and 168, will come with that hardware too, of course. In other particulars they are much like the 155 and 165 which they replace.

What the user realizes from the change-over is not only the ability to address up to 16MB of memory in a single program, but also of running more jobs at a time, and of dedicating partitions or regions to specific applications without necessarily tying up real memory. He can always keep a partition open for priority runs, although that partition may have zero memory when not being used. Similarly, the user can have a region for systems development, and he can even run a completely different operating system in that region than he is using for production work.

IBM claims that the change-over from an existing operating system to one that is built for virtual memory "will be no more difficult than implementing a new system level." That's good news, as is the fact that no user program conversion is required. Object decks and old JCL will run without alteration in almost all cases.

The first of the compatible operating systems is DOS/vs, a control program

that comes as a surprise to those of us who expected IBM to drop DOS except under emulation. To become available in mid-1973, the new DOS runs on anything up to the 158 (except for unconverted 155s).

DOS/vs will divide real memory and back-up store into 2KB "pages" within 64KB "segments" to support the on-demand paging that IBM's virtual storage concept requires. User programs can have as many 2KB pages of real memory as they can keep active, although those pages will not be contiguous. Pages which go idle for a moment may be swapped out until they are addressed again by the user code. The other operating systems, of course, work similarly, relying heavily on hardware for the dynamic address translation and transparent page swapping.

DOS has been enhanced with two more partitions, a relocating loader, and multitasking of 15 tasks instead of 12. It also gets an upgraded version of the POWER Type III spooling program as a standard feature.

Also included is a new disc access method called VSAM, which replaces ISAM. VSAM provides improved record handling functions, especially for overflow records and batch updates. More important, it is said to be "the first truly device-independent access method" and the first one to provide true data portability across operating systems. (Watch for VSAM's data set sharing capability to be used in later data management program products.)

All of the new operating systems use VSAM, but an ISAM compatibility interface is provided so that programs written to access ISAM files can access VSAM

files instead. There will also be a utility for converting ISAM files.

Enhanced OS/MFT and MVT

OS/vs1, available *now* for systems with 148KB and the dynamic address translation, is a replacement for OS/MFT. The new version, in addition to its virtual memory capability, provides a thing called Job Entry Subsys-

tem which is a revision of HASP. It replaces the MFT writers and readers and has a Remote Entry Services function for jobs coming in over binary synchronous lines. As with MFT, vs1 handles up to 15 jobs in fixed partitions. As with DOS/vs, it swaps 2KB pages back and forth between real and back-up memory.

OS/MVT was capable of running up

to 15 jobs. OS/vs2, its replacement, can run up to 63. vs2 does not get the Job Entry Subsystem used in vs1; instead it gets HASP, which is an option just as it was with MVT. vs2 also uses 4KB instead of 2KB pages. Available in the fourth quarter of 1972, it runs on 384KB 145s and up.

Two questions must be asked about the new operating systems. First, given

Management Summary

- Although virtual memory allows a programmer to disregard his memory usage, such disregard will still lead to inefficient memory and cpu usage.
- Most programs need no conversion, even in control cards, but restructuring them should improve their performance.
- A single program can now address up to 16 megabytes of memory; but for efficient processing, the amount of real memory must be balanced with the amount of virtual memory.
- Many of the artificial restrictions on the use of partitions or regions have been eliminated; this should facilitate the development of new applications.
- The new virtual memory operating systems are compatible with their older counterparts.
- The new operating systems enable a site to check out one operating system while running production work under another.
- 370/135 and 145 users can have the virtual storage facility immediately, and without charge.
- Sites renting 370/155s and 165s should consider trading them in on 158s and 168s to get the virtual storage facility, a probable increase in performance, and a possibly lower rental.
- Owners of 155s and 165s can upgrade to 155 IIs and 165 IIs, but at a cost of \$200,000 and \$400,000 respectively; the model IIs will not get the faster semiconductor memory or other performance upgrades.

The model 158, a replacement for the now-retired 155, comes with a light pen console. Oddly, the 165 replacement can't have the toy.

Virtual Memory 370s

the same mix of jobs, will they run faster or slower than the older systems? Second, do they require more real memory?

The speed question depends heavily on the job mix and on how much tuning a user had done with his old system. It is safe to say that the paging mechanism built into virtual memory management makes for better memory allocation and hence more efficient multiprogramming. Undoubtedly users will have to consider how to modularize their programs to make them run really efficiently, especially so that the operating system doesn't have to thrash around moving the same code back and forth from disc.

As far as main memory requirements are concerned, the virtual memory operating systems are bigger, but not much. As mentioned, virtual memory systems can be run on even the smallest 135. But for comparison, a stripped vs1 system might take 64K, while its MFT predecessor got by on a 40K nucleus. Since the subsystems and utilities are virtually (no pun intended) unchanged, the 24K would represent most of the difference between vs1 and MFT residency.

Beyond that, subsystems, compilers, and utilities can be paged, too, although they may not yet have been optimized for swapping. So fitting one in should be no big problem.

An operating system's operating system

A fourth systems control program was introduced, but it wasn't called an

operating system. Instead it is called Virtual Machine Facility/370. It represents a higher level of software than does an operating system. Its function is to allow the multiple operating systems to run concurrently in the same machine, for example setting up a DOS virtual machine for one user and maybe an OS/vs2 machine for another. It will probably be most used for checking out a new system level while running production under an old one.

The hardware

It takes more than compatible operating systems to run virtual memory effectively. Fast direct access storage devices are required plus some facility to rapidly move chunks of data or program from memory to those devices. With the 370s there are two kinds of storage to consider, the 2305 disc and the 3330 disc pack subsystems.

On the 135, 145, 158, and 168 there is also fast semiconductor storage for that program swapping. That is not true of the older core-based 155s and 165s. Sites with rented 155s and 165s will be expected to simply trade them in for the faster plug-compatible replacements. A modification is available for customer-owned 155s and 165s to make them capable of handling virtual memory, too. However, the modification consists of the hardware required for DAT and a lot of rewiring, but does *not* include replacement memory.

Most 155 and 165 owners will look long and hard at their need for virtual memory before they order the upgrades to make their machines mod IIs. IBM has tagged those modifications with out-of-sight prices. It will cost \$200,000 to upgrade a 155 to a 155 II,

\$400,000 to take a 165 to a 165 II. The work may be extensive, but the pricing seems to be a slap at people who refuse to rent. After all, \$200,000 is enough to buy three or four System/3s; and \$400,000 will almost get you a 370/135 cpu and memory.

Even after the changes have been made to them, the mod II machines will not be competitive with the 158 and 168. Not only are the newer machines faster, but for large memory configurations they are also cheaper. For all practical purposes, IBM has retired the old numbers.

IBM says the 158 executes instructions at a rate from 20 to 40% faster than a similarly programmed and configured 155. Part of its improved performance can be traced to its new n-channel MOS memory technology, which permits 16-byte accesses in 1,035 nsec—twice as fast as the 155. It features 8K bytes of reloadable control store where the 155 had none. It also sports free emulators and free extended precision arithmetic; the latter should make it more attractive to scientific shops.

The 158 also has five groups of improved instructions, including: multiply, move, shift, pack/unpack, and convert.

A typical small configuration of the 158 was quoted at \$49,500/month or \$2,300,000 purchase. For that the user gets: 512KB of MOS memory, one 3505 card reader, one 3525 punch, one 3211 printer, one 3333 disc/disc controller, three 3330 dual-spindle disc pack drives, six 3420 tape drives, and the integrated storage controller required to make the 3333/3330 combination work. Deliveries begin in the

Processor and Memory Monthly Rentals

Memory Size	155	158	% of Change
0	\$19,980	\$30,700*	up 54%
512KB	\$26,030	\$33,300	up 24%
1MB	\$32,570	\$35,900	up 10%
2MB	\$46,840	\$41,100	down 12%

Memory Size	165	168	% of Change
0	\$35,640	\$48,600*	up 36%
1MB	\$47,745	\$53,800	up 13%
2MB	\$60,500	\$59,000	down 2%
3MB	\$73,580	\$64,400	down 12%
4MB	not available	\$69,600	—

*estimated; not actually available

Disc Subsystem Monthly Rental Differences*

CPU	No. Packs	"Savings"
135	2-8	\$1383
	10-16	\$3446
145	2-8	\$ 923
	10-16	\$2996
158/168	2-8	(up \$127)
	10-16	\$1946
	18-24	\$4019
	26-32	\$6092

*These figures represent the differences in rentals between 3330 disc subsystems using existing 3830 I controllers and similar configurations using the integrated storage controllers, 3333s, and 3330s.

second quarter of '73.

Memory on the 158 can be added in 512K blocks up to 2MB, so a big configuration might include the 2MB memory, two card readers, one punch, two printers, four 3333s, 12 3330s, 16 tapes, and the isc. Such a set-up would run \$85,000/month, or \$3,700,000 on purchase.

The pricing

At first glance the pricing seems straightforward. It isn't. First, the cost of the systems to the user has been shifted from the memory and discs into the cpu and its integrated controller. The price is up from \$26,030 for the 155 cpu and 512K to \$33,300 for the 158 and 512K, an increase of 24%. Given the fact that the memory is now far less expensive, at \$2600 for 512K compared to \$6000 for core and \$5260 for the 135/145 bipolar, this means the naked cpu cost has gone up an incredible 54%, as close as we can figure.

And yet, in the big configuration comparison, the 158 cpu and its complement of 2MB of memory costs 12% less than the 155 with 2MB.

This kind of pricing can't do very much for IBM revenues, but it may drive independent memory suppliers up the wall (or out of business).

The big machine

The same pricing and performance games are played with the 168. Although this machine does not benefit from an improved instruction set, it reportedly executes instructions 10-30% faster than a similarly programmed and configured 165. A big part of its boost comes from having a

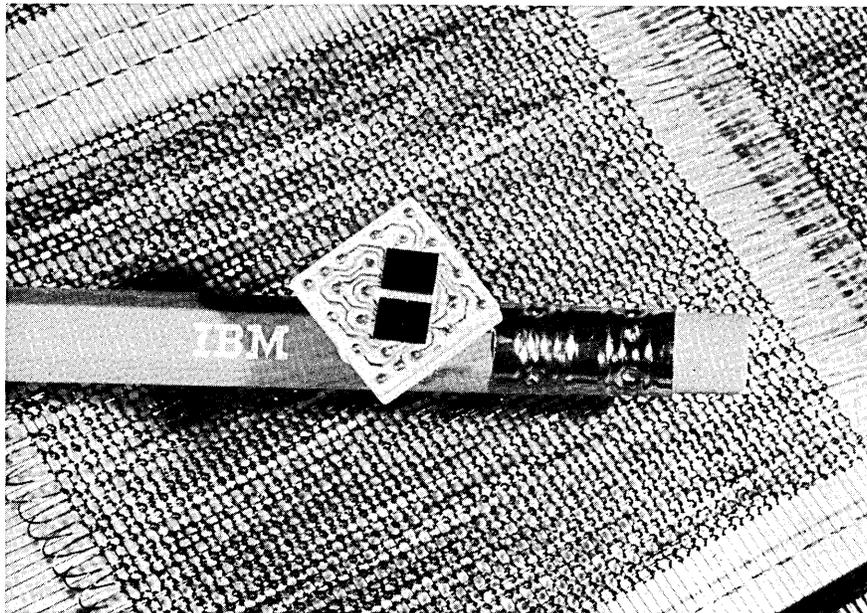

dual bus into the memory controller, making for aggregate data rates in the 16MB/second range rather than the 8-9MB/second quoted for the 165. The 168 benefits from an improved buffer algorithm and a memory access of 32 bytes in 800 nsec (compared to the 165's 2,140 nsec).

The 168 ranges in price from a low of \$93,000/month for the cpu with 1MB of memory, a selector channel, a multiplexor channel, a block multiplexor channel, a 3333, three 3330s, two card readers, two punches, two printers, and ten tape drives. For that gear, a purchase price would be \$4,200,000. Availability is scheduled for the third quarter of next year.

A full-blown 168 would go for \$170,000/month or \$7,300,000 if it included one selector, two multiplexors, two block multiplexors, four 3333s, twelve 3330s, three readers, two punches, three printers, and 32 tapes.

As with the 158, more of the price of the 168 is in the cpu (it's gone up 36% over the 165 price) and less in the memory. A 3MB 168 is actually 12% less expensive than a 3MB 165. The 168 can go to 4MB, too, as opposed to the 165's top of 3MB. (This in itself is strange, since you should be able to do more with less memory under a virtual storage system, but IBM admits "there is no substitute for real memory.")

The pricing of the memory is only one part of what the independents are stirred up about. Another is that IBM has doubled the minimum storage available with the 158 and 168 compared to that of the 155 and 165. (The numbers have gone to 512KB and 1MB, respectively.) And the minimums are built into the cpu frame.

Four n-channel MOSFET (Metal-Oxide-Semiconductor Field Effect Transistor) chips the size of the two shown here provide the same 4K bits of storage as the core plane in the background. The chips run at twice the speed for half the price.

These actions will cut down on the amount of memory that can be sold as add-on.

Still another part of the independents' problem comes from the new products and new prices announced in support of the 3330 disc pack subsystems. For starters, 3330s can now be attached to 370s in two new ways, both cheaper than the existing 3830 I. The first way is through a 3830 II controller, which is not only \$375 per month cheaper but can handle twice as many 3330 dual-spindle drives as the 3830 I. The 3830 mod II cannot be used alone, however. It requires that the first dual-spindle drive of every four attached to it have some control functions. Hence the introduction of the 3333, which is a dual-spindle drive with some control functions. The 3333 runs slightly more than a stock 3330 (\$1627/month vs. \$1300/month), but the resulting subsystems can be much less expensive.

With the integrated storage controller (isc), even the 3830 II can be dropped on the 135, 145, 158 and 168. This feature is variably priced, ranging from \$700/month on the 135 (where it is called an integrated file adapter, or IFA, since it performs some channel functions, as well as control functions) to \$1150/month on the 145 and \$2200/month on the 158 and 168.

Overall, the price of disc support can drop substantially in almost all configurations, but the pricing clearly favors the bigger ones. Theoretically, up to \$6092/month could be saved by using the isc on a 158 or 168 with 32 spindles (instead of the old 3830 I/3330 combination). Even on a 135 with two spindles, the user can realize a \$1383/month savings with the IFA.

This kind of reconfiguration and pricing is great for the user, but it hits the independent disc drive supplier in two ways. First, he can no longer expect to sell a full-blown controller, as IBM has pulled some of the functions into the cpu. Second, he must redesign to match the new interface, and that can be costly.

In the final evaluation, IBM will come out of this with a firm platform for launching itself into data base management and teleprocessing applications. The users should come out with more power or more capabilities for the same or less money. The independents, on the other hand, may simply come out with less money. (For initial industry reaction to the announcement, see the News in Perspective section in this issue.) □

By judicious use of data compression techniques, this installation has realized clear savings of \$10,000 a month

Data Compression for Large Business Files

by Stephen S. Ruth and Paul J. Kreutzer

Data compression is of interest in data processing because it offers cost savings and the potential for increased capacity in mass storage devices, channels, and communications lines. This paper will review compression techniques as they apply to business data files and describe an implementation of data compression on a business type drum file under severe constraints of core space, execution time, and compression requirements.

Definitions

A compressor is a software routine or hardware device which accepts a string of bits or characters of data and transforms it into a shorter string. A decompressor is a routine or device which transforms the compressed string back to its original uncompressed form. Compression ratio or figure of merit (1)* is the measure of degree of compression expressed by the fraction:

$$\frac{\text{Length of Original String}}{\text{Length of Compressed String}}$$

A variety of data design techniques

*See corresponding number in reference table at end of article.

resemble compression; however, they are not included in the above definition since they are applied at the time the data record is designed, and not inside a hardware or software "black box." These data design techniques include header-trailer techniques, packed fields, dual purpose fields, decimal to binary conversion, abbreviating or de-

to which they will apply, it is worthwhile to examine some general characteristics of business data files.

Fig. 1 is a fictitious but hardly untypical customer order record. The most conspicuous feature of this record is the large percentage of zeros and blanks. The prevalence of the default or null characters, zero and

vising coded values for individual data elements, field differencing, etc. Data compression may take place independently of and in addition to field level data coding and other space-saving data design techniques.

Business data files

Since compression routines are designed specifically for the type of data

blank, is not necessarily a result of poor data design. They occur because:

1,3,4,6 Space must be allotted for a maximum sized value, but the value which actually occurred was less than the maximum size.

5,7 Space is allotted for information which is not applicable or not avail-

able at present, though it may be applicable at an earlier or later time.

- 8 Space is allotted for information which is not applicable to all records.
- 9,10 Zero or blank is a meaningful code for this field.

A compressor for business type data should attempt to exploit the high proportion of default values which typically occurs.

A second feature of business records illustrated in Fig. 1 is that they consist of an arbitrary alternation of alphabetic and numeric fields of uneven length, usually short, and successive fields are usually not related to each other in any predictable way, either in content or in size. This will preclude the use of compression techniques that rely on wholly numeric data, uniform field sizes, or which attempt to exploit a relationship between the values in successive fields.

The final feature of business records that is of importance in compression is that all characters of all fields are significant, even when data is not present in the fields. Any loss of data in the record of Fig. 1 could possibly result in a serious error in filling or billing the order. Consequently, compression techniques which perform rounding, truncation, which must permit a certain error tolerance after compression and decompression or which achieve compression by permanently discarding portions of the data cannot be used for business files. No loss or change of data can be tolerated. The data must be reconstituted, bit for bit, exactly as it was prior to compression and decompression. It is this characteristic of compression which drastically separates business data and telemetry data (2).

Types of compressors

Null suppression. This class of compressor includes a wide variety of routines which suppress zeros, blanks, or both. These are the simplest of all compression routines. They are widely used in business data processing, often to the exclusion of any other techniques. Null suppression could almost be called the *de facto* standard method for compressing business data files. It takes advantage of one of the most prominent characteristics of business data files, that is, the prevalence of blanks and zeros. It is simple in concept, easy to implement, and usually achieves a reasonable degree of compression at a relatively low cost in cpu time. Null suppression can be easily packaged as a generalized routine which can apply to many different files and is routinely supplied in many vendor implementation packages, especially for data transmission to peripheral devices, such as printers.

On the negative side, null suppression does not usually achieve as high a compression ratio as some other techniques.

Fig. 2 illustrates zero suppression by bit mapping. A bit map is appended to the front of the record. A one in the bit map indicates that data is present in that relative position of the record; a zero indicates no data. Units containing all zeros are dropped from the record during compression and reinserted during decompression.

The fixed size units represented by each bit in the bit map can be of any length. On word machines it is convenient to use words as the unit, since this provides extremely fast compression. Smaller units, halfword, character, hexadecimal or octal, tend to improve the compression ratio slightly on typical data, but at a large cost in cpu time due to the larger number of iterations.

It is also possible to use bit mapping

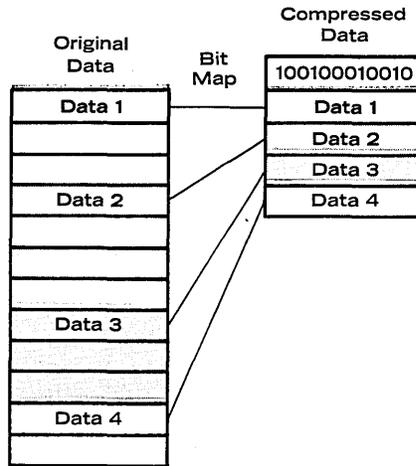

Fig. 2. Zero suppression by bit mapping.

compression where the bits represent data fields, or units of uneven size. When this is done, the compressor must have access to a table which gives the lengths of successive fields within the record (3).

Compressed data:
AE1#2X#1456#4N#3

Fig. 3. Run length coding.

Another of the many ways of implementing null suppression is the common run length technique (4) shown in Fig. 3. A punctuation mark is inserted to indicate a run of zeros, plus a number to indicate the length of the run. #n is substituted in the data string where a string of null characters longer than two occurs, n representing the number of zeros or blanks replaced, minus two.

Where the character set includes characters which do not occur in the data, as in EBCDIC, it is convenient to use one of these unused characters as the punctuation mark for a run of zeros. If there are a number of unused characters, a single character can indicate both the fact that zeros have been suppressed and the number.

If the character set contains no unused characters, as in the case on six-bit character machines, the technique may still be used by selecting an infrequently used character as the punctuation character and doubling it when it occurs as part of the data.

Pattern substitution. Business data files often contain stereotyped patterns that occur in record after record. These may include numeric and alphabetic information combined with or in addition to the inevitable strings of zeros and blanks. Fig. 4 illustrates how a table of frequently occurring patterns may be used for compression.

The compressor can be built to scan the data and build its own pattern table or the table can be prepared in advance. The pattern table can be stored or transmitted with the compressed data (5), or it can be built in as a permanent part of both compressor and decompressor. As with null suppression, it is convenient to use unused characters from the character set as substitute values if these are available.

Pattern substitution achieves a greater compression ratio than null suppression, since patterns in addition to strings of zeros and blanks contribute to the compression.

Efficiency is a serious problem in pattern substitution compressors since many comparisons must be made between the data and the pattern table in

order to identify a pattern. Patterns are of various lengths, and may be subsets of other patterns. The pattern table may be organized in tree form to reduce the time required to identify a pattern (6).

Statistical encoding. Statistical encoding takes advantage of the statistical probabilities of occurrence of message units (in this case, characters) so

Data Compression

that short representations are used for characters which occur frequently, and longer representations for characters which occur infrequently. Morse code, for example, uses short code groups for the common letters, longer code groups for the rarer ones (4). Bemer's digital shorthand (7) is a version of the same concept where the unit is words rather than characters.

When binary ones and zeros are used to represent a message in variable length codes, there must be a way to tell where one character ends and the next one begins. This can be done if the code has the prefix property, that is, that no short code group is duplicated as the beginning of a longer group. The Shannon-Fano codes are an example of such prefix codes (8), (9).

Huffman codes (10) have the prefix quality and in addition are minimum redundancy codes. They are optimum in the sense that data encoded in these codes could not be expressed in fewer bits. Several applications of this technique have been reported recently (11), (12).

Fig. 5 shows the combinatorial technique used to form Huffman codes. The characters in the character set are listed in descending order of probability of occurrence. The two groups with the smallest probabilities are selected and a zero is assigned to one and a one is assigned to the other. Their probabilities are added together and the combined group is merged into the diminished list on the basis of their new combined probability so that the list is again in order of decreasing probability. The procedure continues until a single group remains.

If fixed length binary codes were assigned to the five characters in the

erties of the file change over a period of time. They are most appropriate for permanent files with stable content.

Telemetry compressors. Most of the research and technical articles on data compression pertain to telemetry. Papers by C. A. Andrews (3) and P. Elias (14), and C. Kortman (2) contain a survey and summary of telemetry compression techniques. A more recent bibliography developed by Ruth and Villers (15) summarizes a wide variety of compression articles in telemetry and other fields.

In a telemetry application a sensing device records measurements at regular intervals. The measurements are transmitted to a remote station for study and analysis. Compression is applied prior to transmission to reduce the total amount of data to be transmitted (2).

Telemetry compressors assume as data a succession of numeric fields of uniform size and the value of each field is closely related to the value of the immediately preceding field. These conditions do not exist in typical business files and consequently the techniques used in telemetry compressors have not, so far, been successfully adapted to business files.

Practical application

In connection with the discussion on practical considerations in implementing compression, we use as an example the Requisition Status File which is used at Navy Inventory Control Points. This file contains more than a million records and occupies five FASTRAND II drums in all. It is inquired against and updated on the Univac U494 from remote terminals as well as by batch runs in random and sequential order.

Feasibility. The decision on whether to use compression for this application considered the following issues:

1. Compression is suitable primarily

feasible on fast computers or on systems which are I/O bound. Medium speed or slower computers or systems which are primarily compute bound are limited in the amount and type of compression that is feasible.

4. Compression is more suitable for files which are accessed randomly. The cost of compression is minor compared to the cost of a random access to mass storage and increases the run time in random programs by a very small percentage. On sequential runs, however, where I/O is blocked and each record in the file must be decompressed and compressed, the effect of compression on run time can be drastic.

5. Feasibility depends to a great degree on the amount of redundancy in the file being considered. Files with many zeros and blanks are, of course, good candidates.

Our example, the Requisition Status File, qualifies on all the above points except possibly the last. The file is very dense in information content with relatively little stereotyped information and few blanks and spaces. However, there were urgent requirements, new changes, which would require the record to double in size. The choice was either to double the number of FASTRANDS used for the file or use compression. The latter was chosen. Because of the somewhat untypical constraints, we feel that this application is perhaps an "acid test" of compression rather than a standard example.

Choice of algorithm. Tradeoffs of savings in mass storage space against cost in cpu time should be the dominant consideration in the selection of the compression algorithm. In the case of the Requisition Status File, additional constraints were imposed. First of all, it was absolutely necessary to achieve more than a 2/1 compression ratio. Since the records of the file correspond to a sector, the smallest readable unit on the FASTRAND II, if the compression ratio did not consistently exceed 2/1, the file would have to increase in size. This is, of course, not a normal constraint in most systems. Core limitations dictated that the compression and decompression routines together occupy no more than 2K words. Finally, although access is primarily random, there were some sequential runs, and to limit the run times of these, a goal was set of 6 milliseconds for either compression or decompression of a 330-character record.

In addition to mandatory requirements in compression ratio, core space and execution time, two features were considered to be extremely desirable: data independence and transparency to the program. Data independence is de-

Character	Probability of Occurrence	Huffman Code
0 E	60%	0)
1 T	20%	10)
2 4	10%	110)
3 B	6%	1110)
4 A	4%	1111)
	0) 10%	10) 20%
		110) 40%
		111) 100%

Fig. 5. Formation of Huffman codes.

character set of Fig. 5, each would require three bits. Messages written in the Huffman codes given will average 1.7 bits per character.

Huffman codes are usable for business data files. They provide a moderate amount of compression with relatively moderate cpu overhead and use a small amount of core.

On the negative side, Huffman codes lose effectiveness if the statistical prop-

erties of the file change over a period of time. They are most appropriate for permanent files with stable content. Compression on tape files is seldom practical because the gains in storage cost, reels of tape, is minor and the tradeoff between channel time saved and cpu time spent is marginal and often unfavorable.

2. Compression is especially suitable for large files, where savings in storage costs can be substantial.

3. Compression tends to be more

sirable in order that the compression logic may be applied without change to other files and to avoid change to the compression logic as the record undergoes frequent minor modifications, such as adding new fields or redefining field lengths and contents. Techniques such as differencing, decimal to binary, and table lookup (12), which amount to recoding values for individual data elements, are not data independent unless they can be table driven. If the routine can be applied to another file or if it can be made to accommodate changes to record format and content by merely altering values in a table, the objective of data independence is achieved. Transparency to the program implies that no application program statements are required to invoke compression or decompression.

Finding an algorithm that would meet these requirements proved difficult. Fig. 6 lists the algorithms tried. Evaluation was by applying the algorithm to a representative portion of the file. Proprietary packages were benchmarked. The algorithm selected was Huffman coding with the character set extended to include patterns. Strings of BCD zeros, binary zeros and blanks were considered to be single characters for the purpose of encoding. The addition of patterns of zeros and blanks takes advantage of the fact that when default values occur, they tend to occur in continuous field sized units. The Huffman code alphabet which was used consisted of 76 characters, the 64 characters in the U494 character set and 12 patterns treated as characters.

Packaging the algorithm. In the random environment it was possible to

used to randomly access the file were left uncompressed, as well as certain fields used for selection in sequential runs. This allows the sequential program to expand only those records which will be processed, thus saving time in runs which do selective processing. The existence of an uncompressed header portion reduces somewhat the compression that can be achieved.

Fixed size records become variable when compressed. It would have saved drum space to reorganize the file to consist of large fixed size blocks which contain the variable sized records abutted end to end without regard to sector boundaries. Due to a number of conditions it was not feasible to modify the file access software to this extent. Records are still stored and retrieved in one-sector units. If the compression routine fails to compress the 330-character record to 165 characters, another whole sector must be used.

Performance. The compression achieved on the Requisition Status File was 2.58/1, which was adequate. The cpu time required was 7.5 milliseconds to compress the 330-character record and 9 milliseconds to decompress. This fell short of the goal of 6 milliseconds each to compress and decompress and is considered barely acceptable. Core requirements were 500 words for the compression and decompression routines plus some additional coding to change the file access software. This was well within the requirements. Run time for random programs shows no noticeable increase. Run time for some sequential programs was increased by as much as half. The analysis of this project required a balancing of the sav-

hence, any use of data compression in other applications should be substantially easier.

Cost vs. benefits

Development costs of the compression routines were about 1,300 man-hours, valued at approximately \$12,000. The cost of computer time and supplies used in development was not recorded.

Cost avoidance savings in rental and maintenance costs for five FASTRAND drums is \$20,250 per month, assuming no additional control units or channels.

No cost avoidance savings were calculated for site expansion which would have been necessary to house the five FASTRAND drums.

Cost in cpu time due to compression could not be measured exactly since major additional program processing was implemented simultaneously with compression. However, the total amount of increased cpu utilization due to compression at all ICP activities is estimated to be 82 hours per month. This total is spread over seven cpu's.

In rough terms the development costs were amortized within the first two months of operation and thereafter a clear monthly savings of \$10,000 resulted.

Further applications

In view of the results achieved on the Requisition Status File, the technique is being evaluated by the Fleet Material Support Office for other Navy supply files and for other equipments used by the Navy for supply applications, notably the 360/65 with 2314 disc. There appear to be no significant problems in applying the technique to the 360. In fact, improved performance on this machine is expected because of the availability of character level addressing. On the Requisition Status File implementation, speed of compression was the least satisfactory aspect. The bulk of the software time overhead was not in the translation, but in the word-level housekeeping of disassembling the input string and reassembling the output string. This housekeeping would be greatly reduced and simplified on any machine with character level addressing.

Another area of improvement expected on the 360/65 configuration with 2314 disc is added flexibility in selecting the size of read/write units, since these are not inflexibly dictated by the 2314 hardware.

Particular files under examination could yield compression ratios of up to 5 to 1, or more. Of special interest also are files which are currently bit and word oriented but which are planned to be converted to character orientation to support a conversion from assembly language to COBOL and are

make the compression function transparent to the program by incorporating it into the file access software. In sequential runs, and runs which process the file dump tape of the Requisition Status File, this was not achieved.

The routines were designed to be table driven so that the compression logic might later be made to apply to other files.

The keys within the record that are

ings in not buying five large drums against the losses in throughput for sequential programs and the obvious risks inherent in forcing an additional level of translation for each access of a volatile file. A marginal analysis indicated that compression was worth the risk in this case. Again, it should be stressed that this application involved files which, we feel, were far more difficult to compress than typical ones;

Data Compression

therefore expected to balloon in size.

Compression ratios of from 2/1 to 5/1 can be achieved on many business type files. Every large randomly accessed mass storage file should be evaluated for its susceptibility to compression.

Research on compression for business files is continuing, though no dramatic breakthroughs are expected.

Null suppression will probably continue to be the most common compression method for business files.

The importance of compression for mass storage is related to cost of mass storage devices. The per-character cost of mass storage has had a downward trend, but due to increased use, the amount spent for mass storage has gone up. New developments, such as the HDDR devices which enable more data to be stored on current mass storage devices, laser memories or other breakthroughs may further reduce the cost of mass storage and hence the importance of compression; however, it is unlikely that the cost of mass storage will become low enough to eliminate the need for compression altogether.

In communications, compression is likely to increase in importance and find a larger place in remote networks for business activities. □

Commander Ruth is the director of the computer environment division for the Navy Fleet Material Support Office. He is responsible for systems software support and related research and development for a multisystem, multivendor network of Navy data systems. He is a graduate of the U.S. Naval Academy and has a PhD from the Univ. of Pennsylvania.

Mr. Kreutzer is head of the environment development branch of the Navy Fleet Material Support Office, Mechanicsburg, Pa. He was previously a naval aviator with the Pacific Fleet. He has a BA in Latin and Greek from Benedictine College and has done graduate work at the Univ. of California, Berkeley.

Buying outside software has its risks but you can reduce the odds against you by ignoring the conventional wisdom and doing your own research

Facts and Old Wives' Tales

by Naomi Seligman

The computer software sector is unique among personal service businesses.

Law firms are selected once in a corporate lifetime, while the average data processing manager may run through as many as six or eight different software services a year. Accounting firms are selected with totally pre-defined charters of responsibility, while software services contracts are vague and their activities undefined. Advertising agencies are chosen on the basis of a proposed campaign; software firms generally do not provide any real examples of their work before a contract is signed.

It may be the immaturity of the industry, the inexperience of data processing managers, or perhaps just the nature of computers and computer programmers. Software firms are generally selected on the basis of old wives' tales which, often as not, have no basis in fact.

Four of the most prevalent follow:

1. *Old wives' tale:* The best way to handicap software firms is size. At least you can be certain that the company will be around when you need it. Further, a big company generally has the largest staff of the best professionals.

Fact: Of the 20 largest firms at the end of 1969, eight are no longer in business at all, or no longer in the software business, or have been assimilated to such a degree that they do not exist either as a legal or operating entity. At least 50 clients were left mid-stream by these sinkings. Of course, the vast majority got out before the strains of "Nearer My God To Thee" were over, but at unknown cost to themselves and their projects.

Fact: Size does not appear to guarantee profitability, one logical measure of survival potential. In 1971, firms with revenues of less than \$250,000 averaged a 3.4% profit, those with sales of \$251,000 to \$750,000 generated 1.9% profit, and the largest firms lost an average of 12.2%. Smaller firms are more capable of cutting costs, including officers' salaries, if business starts to slip.

Fact: Less than 20% of the staff of

the five largest "software" firms in the industry is actually involved in the design and programming of software. The rest keypunch, operate computers, deliver listings, manage or market.

Fact: The 10 largest "software" firms at the end of 1971 billed clients approximately \$397,500,000, but only 12% of that billing resulted from software purchased by the business sector. Revenue from other services to corporations such as facilities management, time-sharing, batch processing and machine time sales was 18%. Share received from government agencies was 69%. Upon review, it appears that eight out of the 10 had an "angel," a single large customer who provided between 20% and 80% of revenue and a sometimes tenuous sense of security. To conclude, many "large" software firms are not particularly sizeable when measured in terms of producing software for the business sector. In fact, at least 40 "small" firms received as much revenue from this source as four out of five of the largest in the industry.

2. *Old wives' tale:* The way to pick a software house is to choose the lowest bid. All these companies have the same management capabilities, the same people, and the same overhead rate. Choice of firm doesn't mean much if all you're buying is bodies.

Fact: It is easy to get the most elaborate proposals from companies with no fulfillment staff in the immediate area. Out of the 60 software business addresses listed in the New York Telephone Directory, 26 are sales offices or answering services. Most are among the largest firms in the industry. They are certainly able to truck in their staff but the client always pays in expenses, morale and time away from the project whenever the project manager's baby's teeth need fixing.

Fact: Project management is a sometime thing in even the 10 biggest software firms. The number of professional project managers who have been responsible for a team of more than four programmers at any time in the last two years in the top 10 firms runs from 15 in the best case, down to two.

When you pick a firm make sure the local heavy isn't yesterday's salesman or middling level programmer.

Fact: 60% to 70% of the revenue that these 10 firms generate from software development results from body-shop contracts in which the vendor had no management responsibilities whatsoever.

Fact: There is no Fahrenheit gauge relating man-day rates to man-day quality. Well-known software firms pay between \$11,000 and \$30,500 a year for individuals with the universal description of "senior systems analyst." The same individual can be billed out at hourly rates ranging between \$15 and \$35 an hour. There are no collar insignia, and the \$15-an-hour man in the morning may turn out to be billed for \$35 in the afternoon. Of course, the key determinate in man-day rates is overhead and profit, which accounts for 50% of the billing rate in some firms, and up to 75% in others.

3. *Old wives' tale:* The best software packages are those designed originally with multiple users in mind, and the best way to spot this is by counting the number of users on their client list.

Fact: Each of the five major payroll packages was originally developed under contract for a single client and marketed as a package as an afterthought. (One payroll package, with more than 100 customers, in operation for five years, is still paying royalties to the bank for whom it was originally developed.) Even in the more esoteric systems software area, six of the top 10 packages were originally developed for single clients.

Fact: Many of the companies on any long client list of package purchasers have never installed it. They either bought it to cannibalize parts or train their staff, or it never worked the way they anticipated. Last year, 12 references, out of 20 sales, given by the proprietor of one payroll package were in this category. This year, half of the 14 banks that purchased and paid for the top commercial loan package reported a similar result.

4. *Old wives' tale:* Forget outside

Old Wives' Tales . . .

computer services. It is always less costly and troublesome to use the in-house staff. They know more about the environment and are more likely to get the system in on time and within budget.

Fact: The average real cost per day of in-house staff in a 100-man organization considering overhead, fringes, and, more importantly, management and support staff, runs between \$85 in parts of the Midwest and \$100 in New York. One sophisticated New Jersey

firm figures a full payout cost at \$140 a day, and at a Chicago bank internal staff rates begin at \$160 a day. Other internal staffs may be less anxious to frighten the user departments with their rates, but their real costs are probably quite similar. Commercial rates nationally for the broad middle range of programmers are \$120 a day—only 15% higher than the corresponding in-house rate. Whether this difference should be justified on the basis of an advantage in skills and experience has to be considered on a case-by-case basis but there certainly seems to be a horse race here.

Fact: 85% of all software house

programmers have had at least two years' experience in programming and 70% have worked on some aspects of the same application or techniques in which they are now involved at least once before.

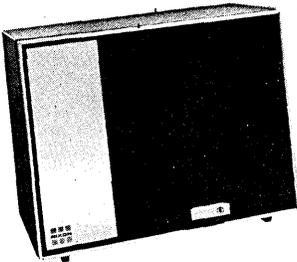

Fact: Nine of the top 10 payroll packages cost less than \$30,000 to buy and average no more than \$100,000 to install. Initial development costs for these systems, financed by the original customer or swallowed by the software firm, run from \$300,000 up. One successful shareholder accounting package now has 67 customers, most of whom have installed it for less than \$32,500. The first user had systems development costs of \$190,000 and used 500 hours of computer test time. This expenditure is comparable to costs cited by other users who rediscovered the wheel. The point is that even with modification costs, there are some real bargains in outside services for the careful purchaser.

Fact: 50% of all contract software projects are developed on a fixed-price basis; 30% of these have overruns, but the cost of the overrun is always negotiable to the user with a good contract. It doesn't take a survey to tell you that this type of guarantee on overruns does not exist on in-house projects, although some organizations with high-caliber management achieve similar results.

Moral: Whatever the old wives chatter, the only way to buy software services is to read beyond the brochures, talk beyond the marketing representative, and ask the same kinds of questions that you would if you were about to invest your money and, perhaps, your peace of mind. Of course, like all other risk situations in business, the only sure outcome if you avoid the decision is guaranteed mediocrity. □

Any media storage cabinet you buy now may be obsolete before it is delivered...

before you buy, find out about the improved storage efficiency and cost advantages of new optimedia™ cabinets

Two years ago we decided that it didn't make much sense to keep designing cabinets that were locked-in to the storage of cards only or tape only or one type of disk pack. So we studied the total media storage problem from all angles and came up with what we believe is the ideal solution, optimedia™ coordinated cabinets can store all types and sizes

of data processing media. They can store them in virtually any combination you desire, and — when your storage requirements change, optimedia cabinets can adapt to the changes. They're sort of a "living" storage system that won't become obsolete or leave you with excess capacity for one medium and not enough for another.

optimedia™ coordinated cabinets have other benefits such as "Action Level" storage that lets you place all media at the most convenient retrieval height, smooth operating roll up doors that open all the way leaving the entire inside fully accessible, and up to 20% extra storage capacity when compared to other cabinets with the same outside dimensions.

So . . . hold up that purchase requisition until you can hear the full story on optimedia™ coordinated cabinets. That way you may avoid buying something that's obsolete before it's delivered.

For the complete story on optimedia™ coordinated cabinets, call your local Wright Line office. You'll find it listed in the yellow pages in all major cities or contact us by writing direct or circling the readers' service number. A more basic approach to analyzing installation efficiency should replace the easy but misleading method based on percentage of computer utilization

Evaluating the EDP Function

by Paul Rau

Recently one of the periodicals created a furor in the edp community by claiming that the average computer was utilized only 48% of the time. Most of the edp professionals laughed this off but the article generated a substantial amount of thought and discussion by people both in and outside of edp.

The 48% utilization figure could be used to reinforce arguments for sharing computers or for increasing the size of the systems and programming staff, but, in too many instances, people seized on this statistic as an easy and immediate way to measure the effectiveness of their edp installation.

Nothing presented here is profound or even complicated.

This line of reasoning, followed to its logical conclusion, could place a premium on inefficiency because the more inefficient an installation, the greater its utilization of the computer. This "instantaneous yardstick" approach has only clouded the real issues of (1) "What criteria do you use to evaluate an edp installation?" and (2) "What unit of measure do you use?" The answer is that the only valid criteria must be edp's effect on the profit line of the P & L statement and the only measure of this effectiveness must be in dollars.

The following is an attempt to expand this approach by presenting a basic tool or procedure that may be

used to evaluate a system and, by aggregating all systems, an installation. Several simple equations are used to illustrate this concept as applied to a system. All factors are expressed in dollars (excepting R1, R2, and M) and relate to a given period of time.

$$(1) \quad B - (D + P) = E \quad \text{and} \quad (2) \quad \frac{B}{D + P} = R_1$$

Where:

B = the benefits received from using that system. The difference in costs, in the using department, between performing these functions with and without the use of the computer are the benefits.

D = the development cost of the system divided by the life expectancy. This figure includes time spent by personnel in the using department, consultant fees, special equipment, etc., as well as the cost of systems, programming and machine time.

P = the current operational or production costs. This includes systems and programming maintenance, supplies and outside services as well as data preparation, machine and clerical costs.

E = the effect on profit.

R₁ = the ratio of the benefits to the costs of using the system.

Nothing presented here is profound or even complicated. A simple ratio of benefits to costs has been established. If R₁ is greater than 1.0, that system is either saving or making money. If it is less than 1.0, the system is losing

money and the function should be performed in some other way.

Summarizing E over all systems indicates whether the installation is running at a profit or a loss. This can be expressed as $\sum B - \sum (D + P) = \sum E$. If E is positive then the total benefits exceed the total costs. The greater E is, the greater the profit.

By expanding equations 1 and 2 potential profits and the ratio of potential benefits to potential costs can be shown.

$$(3) \quad B + \Delta B - (D + \Delta D + P + \Delta P) = E_p$$

$$(4) \quad \frac{B + \Delta B}{D + \Delta D + P + \Delta P} = R_2$$

Where:

ΔB = the potential unrealized benefits. These may be the elimination of the costs of performing the other related functions which should have been included in the scope of the system, the costs associated with the preparation and maintenance of redundant information or the foregone opportunities to increase profit. This situation could be due to a lack of systems integration, narrow scope, a lack of depth, or just poor systems design.

ΔD = the estimate of the additional cost, above the original development cost divided by the system life expectancy, required to provide the unrealized benefits of that system.

ΔP = the potential operational cost savings. These costs may be due to an

abnormal number of reruns, excessive data preparation time, excessive manual balancing or clerical work, bad technical design, etc. They also may be due to excessive maintenance resulting from shortcomings in the original specifications, poor program design, poor language selection or lack of documentation.

E_p = the potential effect on profit.

R_2 = the ratio of the potential benefits of that system to the potential cost.

Equation 4 illustrates a ratio of potential benefits to potential costs. This reflects the benefits and costs of developing and using an optimal system rather than the one currently used. If R_2 is greater than R_1 (it almost certainly will be—no one has developed a perfect system yet) for a system performing the same functions then some improvements could be made in that system.

This leads to one more equation:

$$(5) \frac{R_1}{R_2} = M$$

Where:

M = a measure of performance.

The measure of performance is the ratio of R_1 to R_2 and expresses how close the system is to its optimal performance. A measure of 1.0 indicates that system is perfect and could not be improved. A measure of .5 indicates that system is operating at half the effectiveness it could.

Again, by summarizing the costs and benefits in equations 2 and 4 over all systems, the overall performance of an installation can be measured. It should be noted that systems or installations can be compared on a relative basis. After some experience an absolute standard for M can be established and any system or installation can be measured against that standard.

Several questions are anticipated.

First: "Where can the information on cost, potential cost savings, benefits and projected benefits be found?" These must be developed by following the same steps that are required for a feasibility study. In fact, the results of the initial feasibility study, done before the system was developed, can be used as a starting point for determining current costs and benefits. Space limitations prevent the enumeration of the complete procedures for performing a system feasibility study but they are available in any number of textbooks.

Second: "Isn't this all very subjective?" The development of the current costs and benefits should be reduced to a mathematical exercise because only the current and past performances of the using departments are measured. There is no projection involved. Calculation of the potential benefits and potential cost reduction is more difficult.

However, by using the same standard of rigorous investigation used for feasibility studies, a relatively narrow range of anticipated costs and benefits can be calculated.

Several conclusions can be drawn from the above analysis:

1. Computer utilization is not a valid measure of effectiveness of a data processing installation. The computer, and the extent to which it is utilized, is important only as it affects production costs by allowing faster throughput, providing unused resources, etc. The only way that machine utilization affects the benefit/cost ratio is the potential to increase or decrease one segment of the operational costs.

2. State-of-the-art concepts and technical excellence are important only to the extent that they affect development, production, or maintenance costs. A system or installation is not automatically "good" because of a higher-level language or an "nth" generation computer.

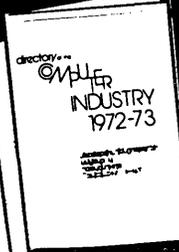

3. In the final analysis, the most important factors in determining the value of systems or installations are the initial selection of the areas to be automated, and the extent to which they are automated. A system could be well conceived, perfectly designed and implemented and still be a losing proposition because sufficient potential for cost saving or profit making never existed in that area.

In conclusion, it has been shown that the value of the systems run on the computer, and not the computer itself, is the most important factor in determining the effectiveness of a data processing installation. This can be readily seen by varying the values of P and B through their reasonable ranges in the above equations. At the same time the framework of an alternate approach to the evaluation of edp systems and installations has been formulated. □

Mr. Rau is now staff edp consultant for AMF, Inc. He was previously data processing manager for Cities Service Co. and before that programming manager for the New York Daily News. He has a BA in economics from San Jose State College and an MBA from the Univ. of Santa Clara.

CIRCLE 101 ON READER CARD

Hewlett-Packard Series 9800. The Name And Number Mean More Than Calculators.

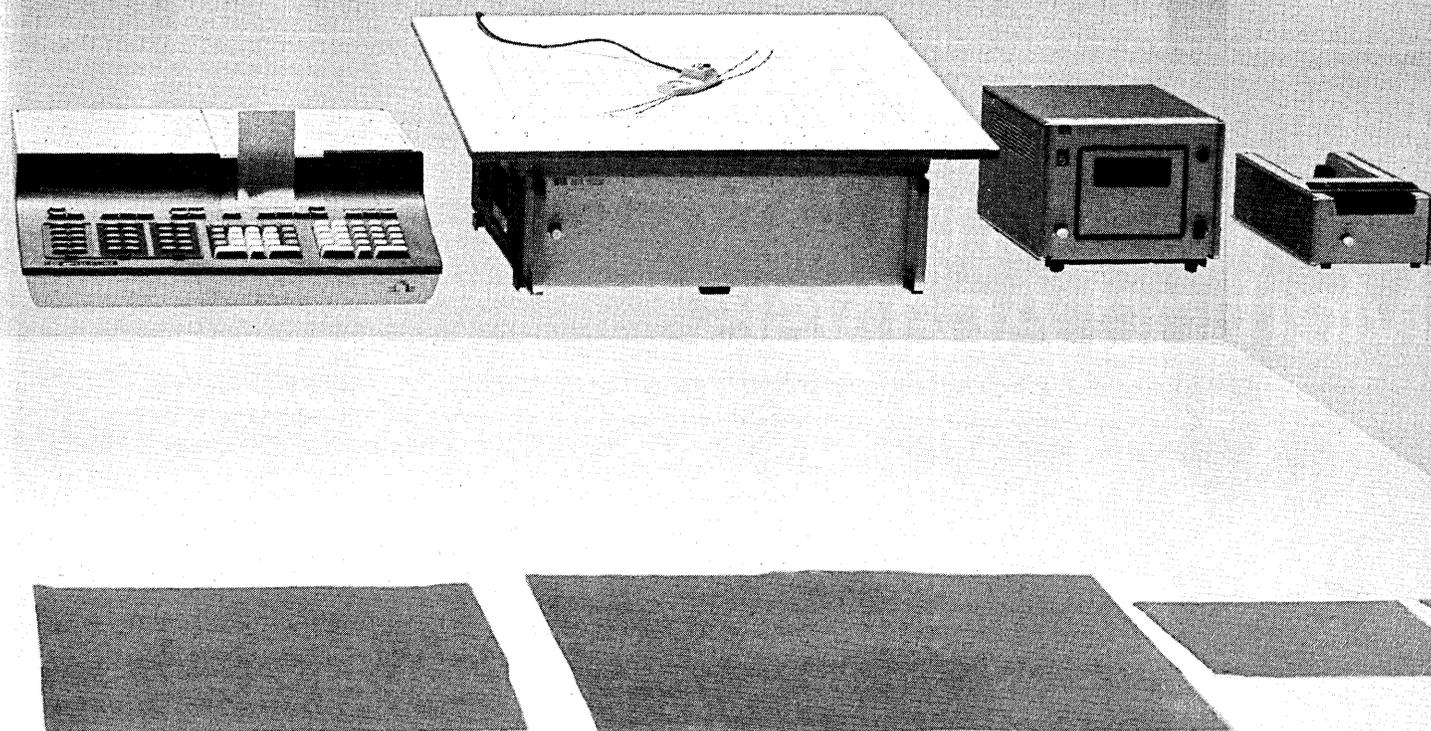

Computing Power Is One Thing.

The most striking example of computing power, that we know about, is our HP-35 Calculator. At nine ounces, this *shirt-pocket powerhouse* marvelously challenges a computer in handling problems from simple arithmetic to complex mathematics. And costs \$395.

If we can package that much power in a shirt-pocket, imagine what our Series 9800 Model 10 and 20 can do:

Model 10. The one for doing repetitive problems (statistics, quality assurance, or surveying, to name a few). It comes with an LED Display, 50 registers *and* 500 program steps of memory. Coming in at under \$3,000, the Model 10 can both perform a complete regression analysis, and solve 10 simultaneous equations. You can add

special functions, memory and printer with or without alphanumerics.

Model 20. The one for a lot of on-the-spot programming of complex problems. You get the best of both worlds: Very fast operation internally, with direct communication between you and the calculator. You key in your problem just as you'd write it—in Algebra and English. It gives you instructions and labeled solutions that you readily understand through its unique alphanumeric display and printer. Add to this Model 20's extensive error detecting and correcting features and its whopping memory—and you'll quickly find that it'll take you from concept to solution faster than any other system around.

What's more, with the Series 9800, you're not limited to the data formats of the Calculator. For input, you have your choice of Marked Card Reader, Paper Tape Reader, or Digitizer; for storage, the Tape Cassette; and for out-

put, a Typewriter, or our X-Y Plotter that both draws and writes.

Support Is Another Thing.

We're in a unique position to help you. It's the aggregate of our experience in virtually every discipline of science and engineering that does it for us. Not just with products but with people. People like your HP Field Engineer. Chances are, he'll bring the solution to your problems with him. If not, he'll put you in touch with someone who will. The point is, he can talk your language. So you do get the most from your investment. Save time in the beginning. And money in the end.

Service Is A Third. With over 170 field service centers in 65 countries, service is available regardless of where you are. For most, it takes only a phone call.

Product Line Is A Fourth.

You probably already know us as one of the world's leading designers and manu-

facturers of precision electronic measurement equipment. To that end we build over 2,000 products for scientists, engineers, doctors, and businessmen.

Today we're a leader in computing equipment as well. Our line runs from the Model 35 Calculator, right on up to the System 3000, a multi-lingual, multi-programming computer. Between those, and all that goes between, we can help you find the most cost-effective solution to your problems.

For more information or a demonstration of the HP Series 9800, write: Hewlett-Packard, P.O. Box 301, Loveland, Colorado 80537.

Although most computer users still rent from the manufacturer, this appears to be the least attractive of the alternatives

Computer Acquisition Method Analysis

by Dick H. Brandon

The computer industry, spearheaded by IBM, started as a rental industry. It was not until January, 1956, by virtue of the now-famous IBM Consent Decree, that IBM was required to sell its equipment. Despite the decree, however, IBM has always encouraged its users to rent their equipment, and today some 66% of all computers are rented from their manufacturers. There are many reasons for the persistence of the rental method, the most prevalent of which is "technical obsolescence." Notwithstanding these arguments, it appears as if outright purchase is the best alternative in most cases, third-party leasing is second-best, and rental is an alternative which is rarely economically viable.

This article explores the three alternatives, and the various methods available for an appropriate analysis.

Factors to be considered

For purposes of this article, it is assumed that a feasibility study has been completed, and that a vendor and a specific configuration have been selected. The decision to be made, therefore, is among three alternative methods of acquisition:

1. Rental from the manufacturer.
2. Leasing from a third party, who has purchased the equipment directly from the manufacturer.
3. Outright purchase, which may be done directly or on some installment purchase plan.

The primary determinant of this decision should be economic, i.e., lowest cost, or lowest cash flow, assuming cash availability. Other factors which have to be considered are:

Leverage. If the equipment is rented from the manufacturer, pressure can be applied for services or other support more readily. If the services are unsatisfactory, withholding payment is one way of gaining attention. An install-

ment purchase, with monthly payments to the manufacturer, has a similar advantage. Notwithstanding this, the manufacturer *should* provide comparable support, regardless of acquisition method. In fact, in the case of IBM, the consent decree inhibits discrimination because of acquisition method.

Obsolescence. The primary argument in favor of rental has been the issue of obsolescence. Presumed flexibility of the rental method allows rapid replacement if technical obsolescence occurs. It should be noted, however, that rapid replacement may be highly undesirable and uneconomic, if a large investment in *systems planning* has not been recovered. The issue of obsolescence comprises three separable components:

Physical obsolescence: Upon wearing out, a machine should be replaced. However, computers are designed with lives far in excess of the time necessary to cover a purchase investment:

Main computer life	12-16 years
Discs and drums	10-14 years
Tapes	8-12 years
Printers, card readers, etc.	8-10 years
Terminals, control units	10-14 years

Thus, physical obsolescence should not be a factor if the breakeven points between all combinations of acquisition methods are less than 8 years.

Technical obsolescence: The 20-year history of the computer field has been beset by change—dramatic technical breakthroughs that increased effectiveness from one generation to the next by several orders of magnitude. Ergo, one argument runs, purchase is too risky. This, of course, is not a true argument. The manufacturers themselves must recover their ever-increasing investments in research, en-

gineering and software development, which requires revenue periods in excess of five years for each new system. Furthermore, the rate of technological change is slowing down noticeably. Speeds are bounded by the nanosecond speed of light, and current developments in MOS and LSI appear to have reached close to the peak for usable capacity. Beyond that, it can be seen that a major change in equipment will not take place; the impact on the installed customer base of *rented* machines would be far too great. It is therefore unlikely that the purchase of a newly announced machine today would result in significant technical obsolescence in the next six to eight years. Finally, of course, technical obsolescence should not affect the user, if the system continues to provide the services required.

Economic obsolescence: The final factor to be considered here is economic obsolescence, that is, the point at which the system can no longer meet the user's requirements effectively. This point is determined more, however, by the user's planning investment than by the equipment cost. In general, a system should be designed and built to allow recovery of the planning costs (design, programming, conversion, parallel operation, testing and the like). Since the planning costs for all applications appear to exceed, in most organizations, the purchase cost of the equipment, the planning amortization period usually exceeds the breakeven period on equipment acquisition.

Economic factors

Aside from cash availability, discussed later, the principal cost elements of the alternate methods are as follows:

1. Rental
Monthly rental payments
Overtime payments for use in excess

of a stated amount

Pass-through of the investment tax credit, usually only one-third, or two-thirds, since it is based on the manufacturer's equipment write-off period of five years or so.

2. Leasing

Monthly lease payments (and no overtime)

Maintenance (which may or may not be separately stated)

Full investment tax credit

3. Purchase

Initial purchase cost

Cost of money on purchase price

Maintenance (except for a warranty period)

Insurance

Residual value

Full investment tax credit

Tax advantage of accelerated depreciation

4. Installment Purchase

Same as purchase except for interest cost paid to manufacturer.

All other burdens of ownership, such as property tax, sales tax and the like are generally comparable.

Method 1—breakeven

The breakeven method determines the cumulative cost of computer use, including the money cost of purchase, but without regard to the time value of expense. The cumulative cost of each method is shown in Fig. 1.

By computing the formulas for the three cost curves, the breakeven points N_1 and N_2 can be determined. Thus, the rental cost can be summarized by

$$C_R = NR + \frac{.1 NR}{1/3 \times 2 \times .07 \times P} - \frac{.1 NR}{10\% \text{ Overtime}} - \frac{.1 NR}{\text{Pre-tax Investment Credit}}$$

Where N is time in months
 R is monthly rental
 P is purchase cost

Similarly the lease cost can be determined by

$$C_L = N \times R - D \times N \times R - \frac{2 \times .07 \times P}{\text{(Rental) (Net Discount) (Full Tax Credit)}}$$

Where D is the net discount percentage, including the maintenance cost after the warranty period.

The purchase cost, without a consideration of possible residual value, is

$$C_P = P + \frac{M \times N}{\text{(Purchase) (Maintenance)}} + \frac{N \times P \times S}{12} + \frac{I - 2 \times .07 P}{2} \quad \text{(Money) (Insurance) (ITC)}$$

Where M is monthly maintenance
 S is an acceptable simple interest rate
 I is insurance cost

In a normal analysis, the costs are known and the variables can be replaced by actual values, except for N . The two breakeven points, N_1 and N_2 , can then be found by setting

$$C_P = C_R, \text{ and } C_P = C_L$$

For purposes of this analysis, however, it is possible to make certain realistic assumptions, and solve the equations in the general case. The assumptions are as follows, using all figures pre-tax:

$P = 48R$. In general, the purchase cost is some function of R ranging from 30 to 50 months. For most computer mainframes the ratio is in the order of 48 months of rental.

$M = .1R$. Monthly maintenance cost is generally about 10% of the rental cost.

$S = .08$. Any reasonable money rate can be substituted.

$I = .01R$. The insurance cost is probably close to 1% of the rental.

$D = .15$. Typical savings in leasing are in the 15% range.

Then, if $C_R = C_P$
 $1.1 NR - .04667 P = P + MN +$

$$\frac{PSN + I - .14 P}{24}$$

Applying the assumptions:

$$1.1 NR - .04667 \times 48R = 48R + .1 NR + \frac{48R \times .08 \times N}{24}$$

$$+ .01 R - .14 \times 48R$$

Since R appears in all terms, it can be cancelled:

$$1.1 N - 2.24 = 48 + .1 N + .16 N + .01 - 6.72$$

$$.84 N = 43.53$$

$$N_1 = 52$$

Thus, after 52 months it is cheaper to purchase than to rent, assuming no residual value.

If, however, a residual value is assumed after the 4½ years to breakeven, the breakeven value is even closer. If for example a 35% residual value is assumed in 4 years (which is undoubtedly conservative considering present market value of four-year-old IBM 360 models) then

$$\text{Residual value} = .35 \times 48R$$

$$\text{Present value (4 years, 8\%)} = .735 (.35 \times 48) = 12.35$$

Therefore, $.84 N = 43.53 - 12.35$

$$.84 N = 31.18$$

$$N_1 = 37.5, \text{ or slightly over three years.}$$

It is unlikely that anyone would wish to rent, if purchase breakeven were to be achieved in 38 months!

Similarly, the lease breakeven calculations can be made by setting $C_L = C_P$:

$$.85 NR - .14 P = P + MN + \frac{PSN + I - .14 P}{24}$$

$$.85 NR = 48R + .1 NR + .16 NR + .01 R$$

$$.59 N = 48.01$$

$$N_2 = 81 \text{ months}$$

Applying a residual value of 20% in 6 years gives the following

$$\text{Present value} = .6302 (.2 \times 48) = 6.05$$

Thus $.59 N = 48.01 - 6.05$

$$.59 N = 41.96$$

$$N_2 = 71 \text{ months, or almost 6 years.}$$

Method 2—discounted cash flow

A second, and more common, method is to determine the actual cash flow of each alternative, discounting it in accordance with a predetermined

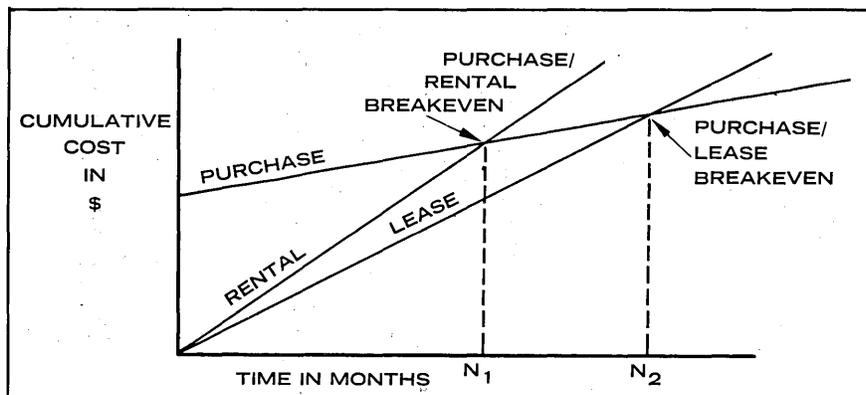

Fig. 1. Cumulative cost

Computer Acquisition

interest rate. The net results are comparable, giving a point where purchase becomes more advantageous. Using the assumptions above, Table 1 gives the cumulative discounted cash flow pre-tax for equipment rental.

Table 2 gives the same information for leasing.

The purchase table is slightly more complex, because of the various payments involved. Table 3 shows purchase, pre-tax, with an assumed residual value table, whose impact is also discounted.

Table 4 compares the various methods on a pre-tax basis, using single payment purchase. An installment purchase would require comparable

Year	Rental Payments (No Overtime)	Tax Credit Pass-Through	Discount Factor 8%	Discounted Cash Flow	Cumulative Cash Flow
1	12 R	(.04667 x 48 R)	1.000	9.76 R	9.76 R

Table 3. Purchase, pre-tax, with assumed residual value

discounting of principal and interest payments.

Tax implications

The tax implications are relatively straightforward. Assuming a 50% tax rate for simplicity allows halving of the costs of leasing and renting. The miscellaneous payments of purchasing are deductible, but depreciation must be calculated separately. The assumption made in Table 5 is that sum-of-the year's digits is used for depreciation

Year	Rental Cost Rx	Lease Cost Rx	Purchase Cost — Rx	
			No Residual	Residual
1	9.76	3.48	41.34	5.34
2	20.87	12.92	41.44	10.33
3	31.16	21.66	41.53	14.78
4	40.69	29.75	41.62	20.66

			24.00 R			

Table 5. Tax implications

method.

Table 6 compares the after-tax costs of the three alternatives. There is no comparison for purchase with residual value because the tax implications of a sale at a profit could be difficult to judge. This can be done easily in a specific case.

Even without consideration of residual value, therefore, purchase is cheaper than renting in 5 years, and cheaper

Year	Post Tax Rx

10	42.36	33.59	25.74

Table 6. After-tax costs

than leasing in 7½, considering the tax implications.

Summary

Various methods of analysis, supported by *conservative assumptions*, indicate that computer purchase is generally the best alternative, with third-party leasing second among the methods. Installment purchase is equally viable, provided that the interest rate charged by the vendor is less than or equal to the rate used in the discount formulation.

It appears clear that purchase is best also when one considers the effort made by the cash-rich vendors to convince their users to rent!

And yet, there will still be the skeptics, who feel that the ability to change after one or two years is worth the extra cost of renting. Even in those cases purchase is recommended. If, through inadequate planning, expansion is required before the natural breakeven point is reached, examine the market value of the installed system. If the market value of the system is high, and in excess of its book value, sell the purchased system for a profit, and make your replacement.

If, however, the market value is low, and the system can only be sold for a loss, purchase a second one at bargain prices, and double your capacity at lowest cost, without a reprogramming or systems investment.

computers carted with care

When you ship computer hardware, look for an experienced computer mover like Burnham Van Service, which helped pioneer the nationwide moving of electronics and other high value cargo. Burnham Van Service has air-ride vans with power tailgates and the most advanced tie-down systems, along with other specialized equipment for moving electronics. More important, Burnham has the know-how to load, move, and unload your computer hardware without damage, and the ability to spot your shipments at all times, day and night, from one end of the country to the other. Call the man from Burnham Van when you're ready to talk about computer shipments. Or write to us and we'll be glad to send you a copy of a new 32-page equipment manual that illustrates Burnham's specialized equipment for handling high-value cargo.

This Honeywell System solved ⁴⁰⁰ a 6-month-old data communications problem in 4 hours!

Recently, a large, Midwestern computer-user came to us with a data transmission problem which had been plaguing him for six months and had cost him thousands of dollars. We solved the problem in 4 hours. While only a small percentage of all data transmission problems involving message integrity are this major, these are the ones that

take weeks or months to solve and can be extremely costly. These are the kind of problems we can isolate . . . in minutes. And save you money in the bargain. Let us prove what we say. Call Robert L. Shipman 303-771-4700 or write MS-218, Honeywell, Test Instruments Division, P.O. Box 5227, Denver, Colorado 80217.

Now...an advanced, low-cost solid state system for hi-efficiency source data collection and transmission.

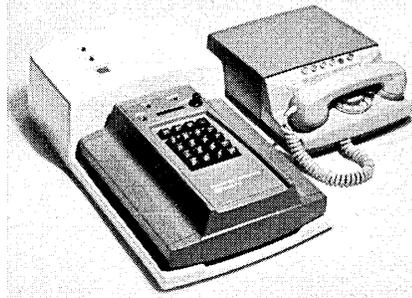

Monarch Portable Data Recorder MDR-2100 System

Seven important advantages for retailers, wholesalers, and manufacturers have been combined in Monarch's remarkable MDR-2100 System. Here is on-site portability, solid-state reliability, operating simplicity, system flexibility, purchasing and operating economy, and effective error protection.

Three units make up the system: the Monarch portable recorder, data transmitter, and computer-compatible magnetic tape receiver.

With this equipment, retailers reduce order writing time, speed deliveries, reduce out-of-stocks and back room inventories, dramatically cut errors, and transmit more information to headquarters.

Wholesalers can reduce key punching, end mail delays, ship faster, cut warehouse inventories, and build customer loyalty.

Manufacturers will find the system capable of efficient data collection for dozens of production, warehouse, and sales office applications.

The Melcom computer, backed by ample software and services, from a company with \$15 billion in annual sales, may prove a formidable competitor

Mitsubishi Moves in Europe

by Gene Gregory

To the outsider, success may seem to come naturally to Japanese companies, but as a Mitsubishi executive put it to us recently: doing business in Europe is like "swimming up a waterfall." For Mitsubishi, success on this difficult, distant, highly competitive market has been complicated by its choice of waterfalls. In the past, Japanese trading companies have made their reputation as buyers and sellers of bulk products, heavy machinery or industrial plant. It was largely their slowness to adopt intensive marketing techniques and to offer the necessary services required by sophisticated high-technology products that led many Japanese manufacturers of electronic products to by-pass traditional trading company channels and set up their own international sales and service organizations. Now the giant Mitsubishi Corp. has taken the plunge in Europe's fast-moving minicomputer and photocopy market, where success can be taken as a signal of further Japanese entries.

When Mitsubishi Shoji Kaisha Ltd. switched its patronym to the Mitsubishi Corp. last year, it changed much more than its name. The recent emergence of Japan's largest trading company on the European computer and photocopy market was the first indication of radical revisions in its basic corporate strategies. These changes have far-reaching implications in markets for high-technology products where financial prowess and global marketing structures are key factors of competitive power.

It is precisely because the field is dominated by multinational giants, as much as because of the rapid growth potential, that the Mitsubishi Corp. decided to assault the European market frontally from beachheads in the U.K. and West Germany.

Previously, Mitsubishi's 12 offices in Europe have bought and sold a vast array of bulk commodities, metal and mineral products, chemicals, foodstuffs and heavy plant and machinery. Some Mitsubishi home electronics products, mainly TV receivers, were sold throughout Europe by Teleton, a German-based firm selling under its own brand name. But Teleton suffered the same fate as many marginal Japa-

nese electronic manufacturers who were totally reliant on price competition; after revaluation they were caught with large volume sales and disappearing margins, forcing Mitsubishi to a rescue-takeover action to preserve its channels of distribution.

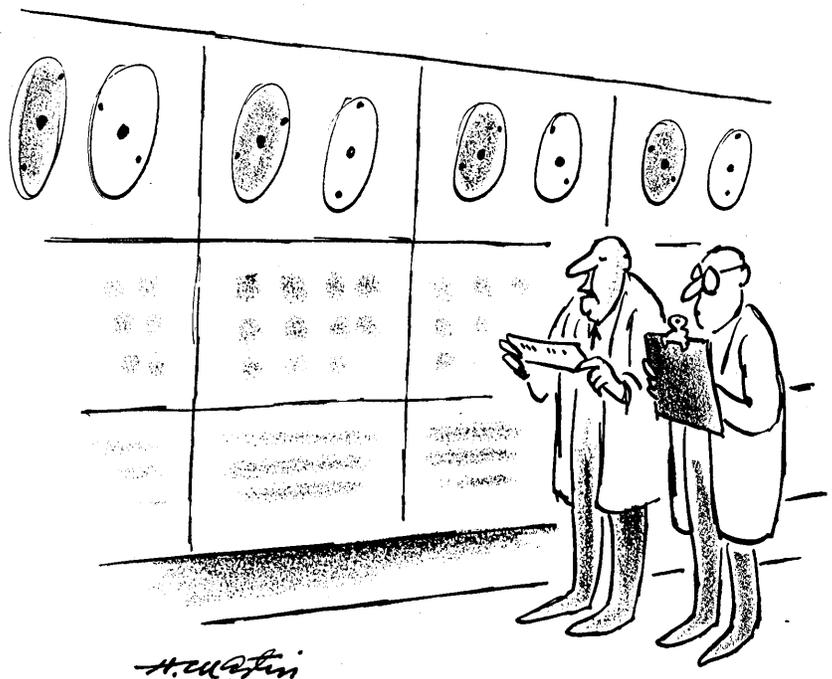

Other members of the Mitsubishi group, such as the quality-conscious makers of Nikon cameras, had opted out of the Mitsubishi stable and decided at the outset to go it alone on the European market with their own intensive marketing strategies supported by extensive service facilities. The mammoth Mitsubishi trading firm, like others of its genre, was slow to realize that with the changing structure of Japanese industry, its future growth depends largely on its ability to market high-technology products requiring heavy added-service value.

The emergence of Mitsubishi Electric as one of the leading Japanese manufacturers of modular, compact "user-oriented" computers provided the necessary catalyst for the big

switch. At the same time, another camera company in which Mitsubishi Corp. has a small interest, Konishiroku Photo Industry (KPI), had developed a new dry photocopy machine with attractive price and quality advantages over the competition. The Mitsubishi management decided to provide the necessary added capital to develop the new line of copiers and produce them for world markets, taking a majority interest in KPI.

Ready for direct marketing

With the two lines of equipment, Mitsubishi Corp. decided it was broad based enough to enter the European market directly. It was only a matter of choosing the time and place, both of which were decided when the U.S. parent of its U.K. distributor, Farrington Data Processing, went bankrupt last year. Mitsubishi Corp. moved quickly to take over its agent's sales, software and engineering organization, with more than 130 trained personnel and offices in major industrial centers

Mitsubishi

of England and Scotland.

Mitsubishi's Melcom computer is medium-sized, designed for use by smaller- and medium-sized companies in sales control, inventory control and invoicing. "We see a tremendous future in Europe," a top Mitsubishi executive told me. "The compact computer will gradually replace the billing machine and become a critical competitive factor for smaller firms. Independent surveys indicate that the market will grow from 20-25% annually until 1975, and we believe that this will continue for some time."

The strategy Mitsubishi is counting on to obtain a solid share of that market is defined by Mitsubishi's European regional manager as a long-term development action. The European market is a big one and "it must be developed with patience." The key elements of that action are:

The will and the means to succeed. The European market is a difficult one, and Mitsubishi is fully aware that some very big multinational firms have failed in their efforts to break into the market dominated by Xerox. "But," Shino says, "Mitsubishi is too big to enter any new field lightly. We have made our decision and we intend to succeed. After all, a company the size of Mitsubishi makes most of the giants in the field look pretty small."

With an annual turnover of about \$15 billion, including about 9% of Japan's total exports, and some pretty powerful banking connections, there is no question of Mitsubishi's financial staying power, which the company believes will inspire user confidence.

Selective national staffing. The switch to direct marketing of highly sophisticated Mitsubishi products has been accompanied by another equally revolutionary change to primary reliance on carefully selected national staff. In the U.K. and German operations there are only three or four Japanese managers and technicians; the rest are recruited and trained locally. Operational management, systems engineering, sales and service are all delegated to nationals, with only top management and some staff functions filled by Japanese.

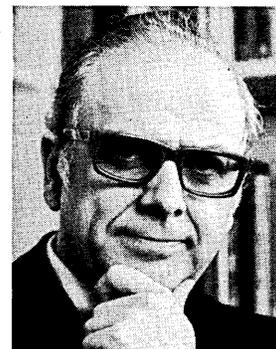

Upstaging software. Mitsubishi places emphasis on software and service. An extensive library of its own brand of software—System Mosaics (Melcom Optional Software Applications for Integrated Commercial Systems)—is supplemented by custom-designed installations. Mitsubishi likes to boast that it is essentially a software and service organization that seeks to

provide a system that will make more money for its customer, and it spares no effort to assure prompt and adequate service to keep Melcom computers on the job.

Flexibility. Mitsubishi will either sell or lease photocopy machinery, depending on the customer's preference. This offers some advantages over other makers with a standard leasing policy.

Reasonable prices. Both Melcom computers and U-Bix photocopiers are offered at highly competitive prices. Melcom systems are designed for maximum flexibility—to use rather lower priced 1,000-word memory discs which can be expanded by an add-on system to well above the million mark. These, in turn, are supplemented by a range of high speed auxiliary tape readers, punches and complementary printers. U-Bix copiers sell for less than \$4,000, a price which has assured market acceptance in Europe as in the U.S.

Mitsubishi is not as much concerned with the present American and European competition in either the computer or photocopy field, as with the emergent Japanese competition in world markets. Canon, Inc., has recently introduced a dry copier, and it is expected that Minolta Camera will soon be in the European market with a range of dry duplicators. Also in the near future, the aggressive Ricoh Company, Ltd., and Mita Industrial Co., Ltd., top Japanese makers of wet Diazo copy machines, are expected to move into European markets, with prospects that competition among Japanese manufacturers for the copy machine sales may rival the fierceness which has driven down prices of desk-top electronic calculators in recent years. □

The proposal to CODASYL's Programming Language Committee that Report Writer be removed from COBOL has prompted a vigorous defense

Using the COBOL Report Writer

by Harry T. Hicks, Jr.

The Report Writer feature has been a part of COBOL since 1962. Since that time it has been COBOL's "forgotten man." Few COBOL users spent the time to learn how to use it and those who did evidently didn't have much to say about the experience. Recently, something happened to bring increased attention to Report Writer: CODASYL's Programming Language Committee received a proposal that recommends removal of the feature from COBOL on the grounds that it is "redundant with current features in the language and too complicated for the general report writing needs of the user community." This event is sure to provoke many responses, both pro and con. This article is one such response—a definite con. Although the primary purpose of the article is to refute the charges against Report Writer, it is also designed to subtly persuade the reader to try Report Writer for himself and, having once tried it, to continue using it thereafter.

The proposal to remove Report Writer makes two contentions. The main one, that it is overly complicated, will be addressed by the remainder of this article. The other, that of redundancy, is based on how one defines a report-producing facility. Certainly,

COBOL has the general facilities for writing report-producing programs, just as it has facilities (other than the SORT statement) for writing programs that can sort files. It even has some facilities specially designed to produce listings: the LINAGE clause and the ADVANCING option of WRITE. However,

PAYABLES PG. 1		
NAME . . .	DUE . . .	AMOUNT .
XYZ CO	6/21	248.16
ACME	6/21	1,117.28
*	6/21	1,365.44
ACME	6/28	98.26
*	6/28	98.26
**		1,463.70

Fig. 1

most business reports are more than just simple listings and, thus, require fairly extensive and often complex code to produce them. Report-producing routines can be generalized just like sorting routines, and in the interest of programmer efficiency they ought to be. Thus, the definition of a worthwhile report-producing facility requires the degree of automation found in Report Writer but nowhere else in COBOL,

and we must conclude that the facility is not redundant with other language features (it may indeed be redundant with facilities outside of COBOL such as RPG programs, but that is not the issue here).

Let's investigate how complicated Report Writer is (or isn't) by using it to code a report-producing COBOL program. The report is shown in Fig. 1.

This looks pretty simple: two heading lines, one with a page number; a detail line; and two total lines, one produced every time the due-date changes and one final total.

Before we apply our complicated Report Writer to this simple report, let's think about how we would write a program in plain, easy COBOL to produce it. The code we would need just to produce the report (not to read the input records, edit them, etc.) is listed below:

1. A file description (FD entry) for the file on which to write the report. This definition would probably include a record description entry for the detail line that contains elementary item descriptions for the name, date and amount fields.

2. Working-Storage descriptions of the two heading lines and two total lines, a couple of counters for the total

lines, a page counter, a line counter, and a field to store the date field for control purposes.

3. Procedure Division code to:

Format and write the heading lines, total lines and detail line.

Maintain the page, line and both amount counters include "rolling" and zeroing of the latter.

Check for a control break (change in the due date) and a page break (line counter overflow) and take the required action in each case.

Maybe this report isn't so simple after all! Let's see if Report Writer helps out.

Using Report Writer we still have to define the output file, but we can omit the record description entry by writing REPORT IS PAYABLES instead of the usual DATA RECORD clause. When this clause appears in an FD entry, no record description entry is needed.

Next, we need to define the report in terms of its layout (what kinds of lines there are and what appears in each of them) and sources (where does the data that appears in the report come from). Shown in Fig. 2 is the complete Report Description (RD) needed to produce the report. Before we discuss it in detail, look it over and see if some of it looks familiar.

It really isn't much different from what the Working-Storage description of the report lines would be—just a few new clauses. There is one *major* difference though. With this Report Description, all you need to write in the Procedure Division to produce the report are the following statements.

```
PROCEDURE DIVISION.
HOUSEKEEPING.
    OPEN INPUT INFILE OUTPUT OUT-
        FILE.
    INITIATE PAYABLES.
DO-REPORT.
    READ INFILE AT END GO TO ALL-
        DONE.
    GENERATE RPT-LINE.
    GO TO DO-REPORT.
ALL-DONE.
    TERMINATE PAYABLES.
    CLOSE INFILE.
    STOP RUN.
```

Let's look at the Report Description piece by piece and see what each does. Report Descriptions appear in their own Data Division section—the Report Section. Each report is described by an RD entry which specifies the broad details of the report, followed by a series of record description entries, one for each group of report lines.

The RD entry names this report PAYABLES; the name is needed for the INITIATE and TERMINATE statements. The clause CONTROLS ARE FINAL, DUE-DATE names the data fields which control the

appearance of total lines. FINAL is a COBOL word that indicates that a final total is desired. DUE-DATE is a field in each input record; when it changes, a total line will be produced before the detail line with the new value is pro-

Fig. 2. Complete Report Description.

duced. Control fields are listed in decreasing order of importance.

The clause PAGE LIMIT 50 LINES, FIRST DETAIL 4 tells the Report Writer to: (1) begin a new page whenever the next group of lines to be printed will exceed the 50th line on the current page, and (2) to put the first detail line of each page on physical line 4; this puts a blank line between it and the two heading lines. If this phrase were omitted, the first detail line would appear immediately under the second heading.

Both page heading lines are described by the Record Description entry beginning 01 TYPE PH.

Most Report Writer data definitions don't require a data name, so none of the page heading entries has one. The TYPE clause specifies the type of lines in the group, in this case Page Headings. The two lines themselves are described by the two level 03 entries and their subordinates. Each line description must include a LINE clause to tell the Report Writer what spacing between this line and the previous line is desired. LINE 1 means "put this line on the first physical line"; LINE PLUS 1 means "single space."

The level 05 entries describe the fields on each line. The description of every elementary item must have a COLUMN clause to tell Report Writer the column in which the first character of the item appears. Also required are a PICTURE clause (just as in other Data Division sections) and one of three clauses to indicate where the data comes from. Two of these clauses are: (1) VALUE—the data comes from the literal written in the clause and (2)

"The political views of our next speaker are well known."

COBOL Report Writer

SOURCE—the data comes from the field whose name appears in the clause (Report Writer automatically moves the data into the report line at the proper time). The name **PAGE-COUNTER** that appears in the first **SOURCE** clause is a special register in which Report Writer keeps the current page number for you.

The definition of the detail line begins 01 **RPT-LINE**; **TYPE DE**; **LINE PLUS 1**.

The detail line is given a name so that the **GENERATE** statement can refer to it. This line is the only type that is explicitly produced by the program; all of the other lines are produced automatically at the appropriate time. The elementary items in the detail line are defined using the **.COLUMN**, **PICTURE** and **SOURCE** clauses just covered. (Notice the editing **PICTURE, ZZ/ZZ**; the **"/** character in a numeric-edited item is a fairly new addition to **COBOL**.)

The last two level 01 entries define the total lines, or "Control Footings" as Report Writer calls them. Each control footing line is associated with one of the fields named in the **CONTROLS** clause of the **RD** entry. The definition of the first control footing line begins with 01 **TYPE CF DUE-DATE**; **LINE PLUS 2**.

The **TYPE** clause not only names the type of line but repeats the name of the control field **DUE-DATE**. Report Writer generates all the code needed to test **DUE-DATE** against its previous value each time a **GENERATE** statement is executed and to produce the control footing line when a change occurs.

The elementary item definitions are the same as those we've been looking at except for the **SUM** clause. The **SUM** clause is used instead of **VALUE** or **SOURCE** to indicate that the data that fills that portion of the line represents a total. Report Writer generates code to accumulate the data item named in the **SUM** clause in a counter and to move the value of that counter to the control line just before it is written. Rolling the counter up to the next level (**FINAL** in this instance) and resetting it to zero are also automatic. The definition containing the **SUM** clause has the data name **AMT-TOTAL**. Report Writer associates this name with the counter so that the name can be used elsewhere in the program to access the content of the counter. Notice that the **SUM** clause in the last line of the **FINAL** control footing definition names **AMT-TOTAL** rather than **PAY-THIS**. This causes Report Writer to roll the counter from the first control footing to the second when a control break occurs on **DUE-DATE** rather than adding **PAY-THIS**

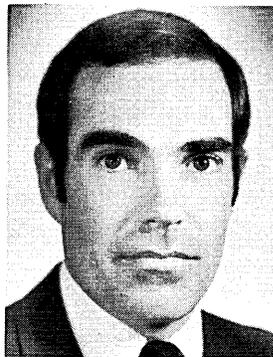

to both counters at each **GENERATE** statement execution.

The last level 01 defines the **FINAL** control footing. This line is produced once—when the **TERMINATE** statement is executed.

Using this Report Definition, the Report Writer portion of the **COBOL** compiler generates all the code needed to produce the report. As noted earlier, all the Procedure Division needs to contain is an **INITIATE** statement to ready the report writing code, a **GENERATE** statement to produce each detail line, and a final **TERMINATE** statement to produce the final control footing line.

You're probably thinking "it can't be that easy" and in most cases, you're right. The Report Writer feature offers much more power than this brief run-through has shown. But, having read this far, you've learned the basics; everything else—the other types of lines, totaling and line control options and such—fit into the framework you now have. And each new feature brings with it enough power to more than compensate for the small incremental learning effort involved.

Is Report Writer redundant and overly complicated? You can answer that question for yourself. Take one of your operational report-producing programs written in **COBOL** and recode it using your implementor's Report Writer (if he doesn't have this feature in his compiler, his phone number or address is probably in the back of his **COBOL** manual) and compare the results. Or, try recording the sample program we just discussed in plain, easy **COBOL**, and compare the results. You'll find that the Report Writer version takes far fewer lines of code, is easier to understand, and is much more readily changed. And you learned all about it in less than one hour.

Mr. Hicks is director of consulting services for Information Management Inc. and has been a member of both the **ANS Working Group** for **COBOL** standardization and the **CODASYL Programming Language Committee**. Before joining **IMI**, he was with **Computer Usage Co.** and **Boeing**. He has **BS** and **MBA** degrees from the Univ. of California at Berkeley.

Computers go from the latest thing to objects of historical interest in a surprisingly short time. Lest we forget..

The Last

Only during the last two years has everybody seemed to be talking about the virtues of making do with what you have, rather than jumping to order the latest machine, but some few people began following this principle far earlier. One of them is Gene Usdin, head of Southwestern Computing Service in Tulsa, Okla.

We went to see him in response to his letter reporting that Southwestern's **ALWAC III**, serial number 5, "had a sinking spell a couple of months ago and is probably not long for this world." As far as Gene knew and we were able to find out, his was the last **ALWAC** in regular operation.

Southwestern has been in business since 1953, starting out with an **IBM 604**. (Since then, many other service bureaus have come and gone in Tulsa, including one across the street.) In 1956, Gene decided to get a real computer and chose the **ALWAC**. The big competition then was the **IBM 650**, and price was a factor in the choice. **Logistics Research Inc.** of Redondo Beach, Calif., the manufacturer, offered a price of \$700 a month for a basic system, including a **Flexowriter**, but without maintenance. The unusual reliability of the machine made this arrangement feasible. As Gene recalls, the first trouble appeared some three months after installation. He called another installation on the phone, described the trouble, got a diagnosis, replaced one tube, and was back in operation. Gene's attitude toward preventive maintenance differed from that recommended in the **ALWAC** manual: he didn't do any. His motto, he says, was "to let sleeping dogs lie and never touch the diodes—the machine had great recuperative powers."

ALWAC

by William J. Rolph, Senior Associate Editor

The new machine arrived in July 1956, accompanied by a three-man installation team. "None of us had ever seen the machine before or knew anything about programming it. Alan Beek (then head of programming for Logistics Research and now at UC

Irvine) gave us a one-day course and then we felt we were ready to be on our own . . ." Gene and his colleagues also had a one-day logic and maintenance course, "so that we would be able to handle our own field service," backed up by a genuine field engineer

who was to be resident at a later installation in Enid, Okla.

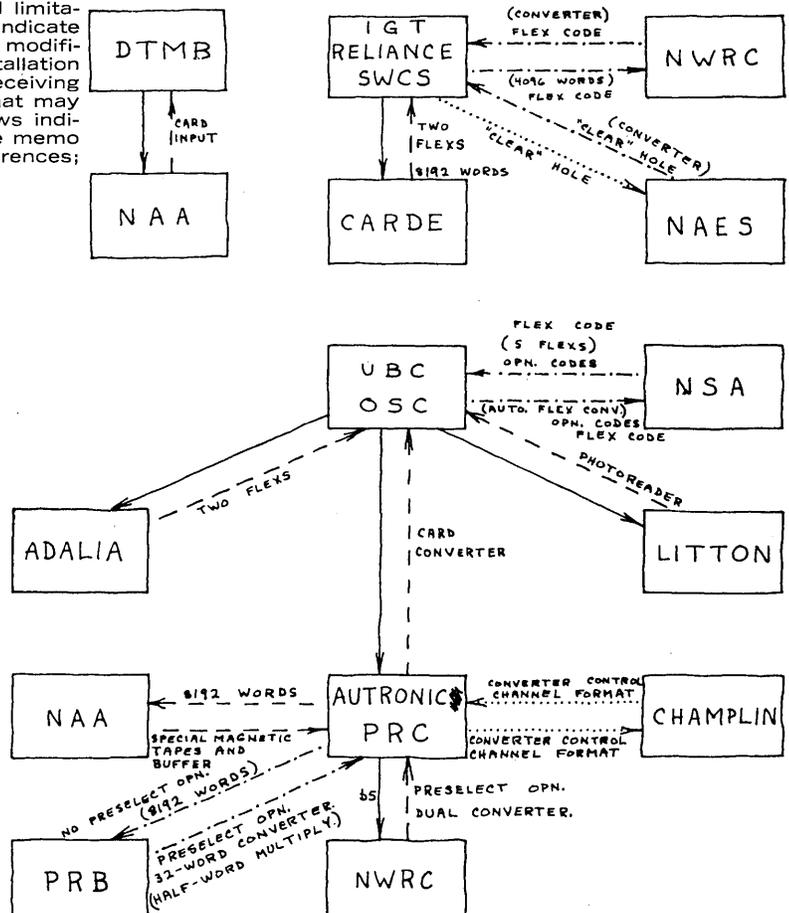

"During the two weeks that the installation team was with us," Gene says, "much of their time was spent glued to the scope looking for noise and substandard pulses. This process

BELOW: An instruction list for the ALWAC. In the olden time, programmers were expected to be familiar with a quaint notation called machine language. RIGHT: This chart and an explanatory memo were distributed in 1957 to ALWAC installations to show the possibilities and limitations of program exchange. The few solid arrows indicate installations able to run received programs without modification. Dashed arrows show that the sending installation has some feature or equipment not present at the receiving installation. Dotted arrows show incompatibility that may require modification or recoding. Dot-dashed arrows indicate both incompatibilities and extra features. The memo concluded by saying that these are only coding differences; engineering differences are not shown.

PRELIMINARY

The Last ALWAC

generated about 100 field changes to our machine, and it was that kind of attention that made the machine work so well for so long."

After their programming course, the group wrote some routines for the open house demonstration, then went directly to programming engineering applications for the bureau's customers, starting with those that had proved a little awkward for the 604 to handle.

The ALWAC was a binary machine with a 32-bit, plus sign, word. The commands were eight bits, "so naturally the programming was done in hex. We all programmed in hex, talked in hex, did mental arithmetic in hex, and
(Continued on page 91)

Wenner-Gren: From Light Bulb Salesman to Merchant Prince

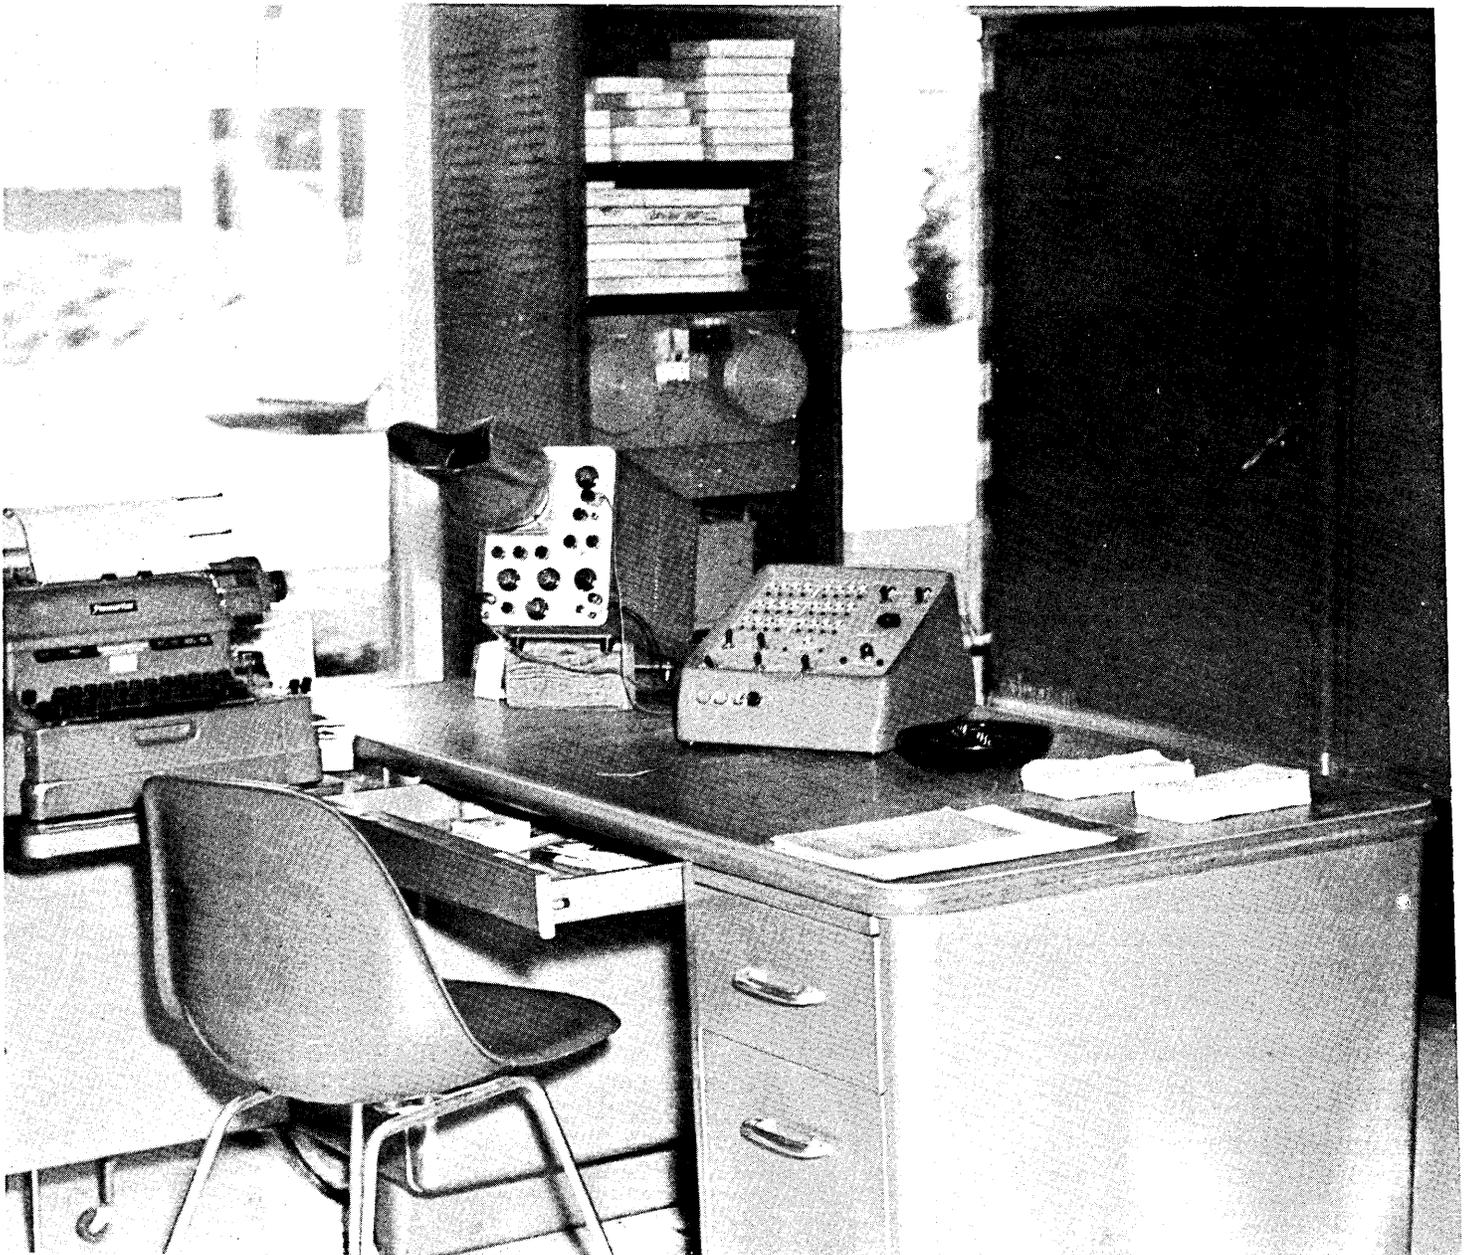

LOGISTICS RESEARCH INC. (the name was changed to ALWAC Corp. about 1957) was founded by Axel Wenner-Gren in 1952 and initially staffed by a computer group who left Northrop, some going instead to start Bendix Computer.

Wenner-Gren's original purpose, according to some who were there at the time, was to develop a computer suitable for planning a worldwide network of monorails, because he owned a large part of a German company that built them.

He owned some other things too. Born in Sweden in 1881, Wenner-Gren went to school in Germany, worked there briefly, then in 1907 appeared in New Jersey, where he had come to seek his fortune—a

venture that proved successful. He worked in a New Jersey factory for 15 cents an hour, then found a job as salesman for a light bulb company with headquarters in Sweden. He may have been the greatest light bulb salesman ever known, because he sold the U.S. government on floodlighting the Panama Canal for its grand opening in 1914.

By 1917 he owned the majority of his company's stock. In 1921 he formed the Electrolux Co., making vacuum cleaners, then acquired plans from two inventors for a refrigerator, leading to formation of Servel. With returns coming in from Scandinavia, Germany, France, Britain, and the U.S. for these products, he bought

mines, power plants, and control of Sweden's biggest wood pulp producer, thus getting five million acres of timber lands. In 1935 he headed a group buying a one-third interest in Bofors Munitions Works from Krupp of Germany, makers of the anti-aircraft guns soon to be produced in many countries under license. Then he arranged with Northrop to build military aircraft in Sweden—a complementary industry for the Bofors operation.

Meanwhile, he had become acquainted with Hermann Goering and made trips between Germany and England in an announced attempt to further the cause of peace. Knowing Goering, however, later led to Wenner-Gren being blacklisted by the U.S. But well before then he had acquired Hog Island in the Bahamas, which he visited on his yacht, the Southern Cross (formerly owned by Howard Hughes), which had a crew of 315.

Wenner-Gren had many other diplomatic ventures, but before starting Logistics Research he also financed the archeological expedition to Peru that discovered the lost cities of the Incas, gave Peru a million-acre park, and arranged the merger of the two competing telephone companies in Mexico, gaining control of the resulting company. At the age of 76, four years before he died in 1961, he undertook the development of 40,000 square miles of wilderness in British Columbia, where he planned to build 15 or 20 new towns, supporting timber and mineral exploitation, and connected by a 400-mile monorail.

Owning the telephone company in Mexico was a factor in the operations of Logistics Research, because the U.S. blacklisting made it difficult to bring money into the country and, according to one of the early employees at the computer company, it was done through the

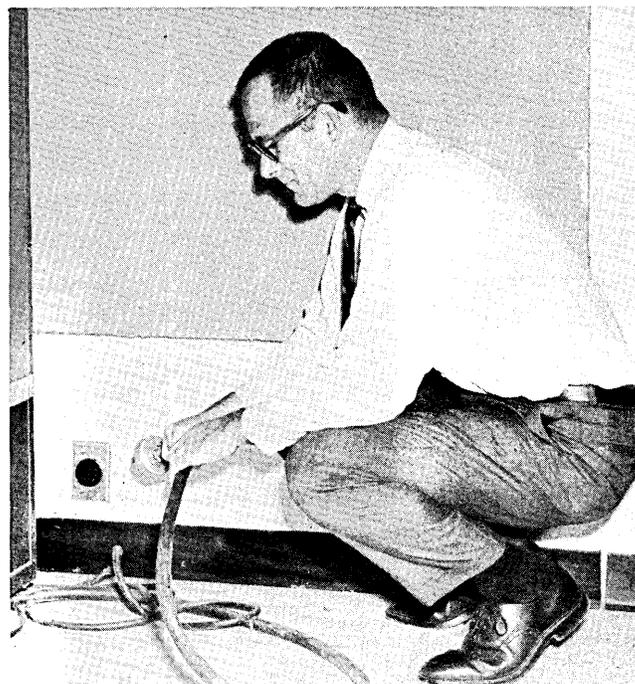

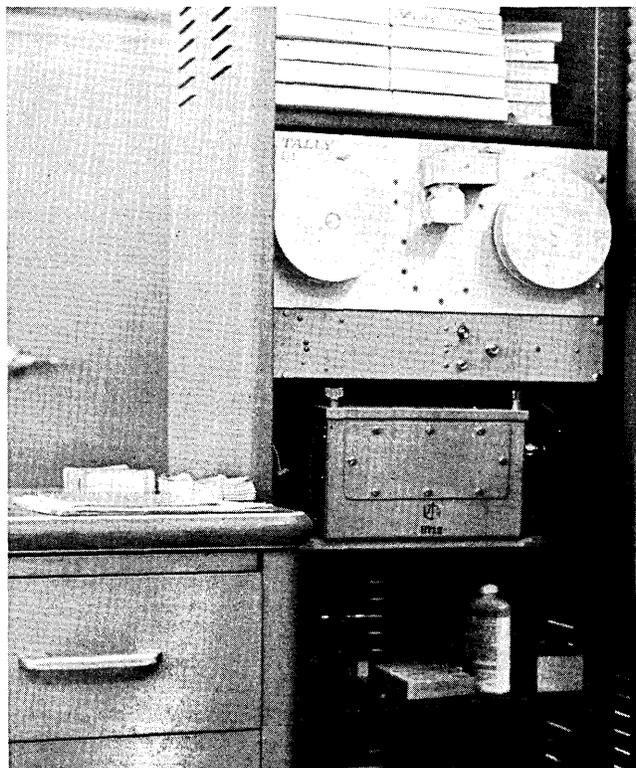

Mexican phone company. The money fostered the development of the ALWAC I, II, III, and III E. But, according to one user, the sales prices were not adequate to cover the costs and leave a profit.

About a year and a half before the acquisition of the company by EI-Tronics in 1958, the ALWAC 800 was under way, an all-new computer promised to the first customer, the Federal Reserve System, in 15 months. "But," says a logic designer who worked there, "we couldn't have designed the circuits in that time." Soon, Wenner-Gren's accountants descended from Sweden and Canada, cutbacks occurred, and the computer wasn't delivered.

DATAMATION noted a final conclusion to the ALWAC story in January 1965: "... a federal judge awarded over \$200K to the Federal Reserve Board as the result of the nondelivery of an ALWAC 800..." □

OPPOSITE PAGE: Southwestern's ALWAC, with mainframe in the two-door cabinet and memory cabinet on the left. Paper tape reader is in open cabinet by the window. Flexowriter, scope, and control console are on the desk. The battered card decks on the corner of the desk were wrapped in rubber bands and used to hit the plug-in tube packages, insuring that they were firmly seated. This procedure was the only regular preventive maintenance at this installation. LEFT ABOVE: Inside this modern building in Tulsa, Okla., the last ALWAC III served for 15 years. LEFT BELOW: Tally high-speed paper tape reader. Auxiliary power supply just below it has small anchor insignia, showing it was Navy property. BELOW: After 15 years of steady production, Gene Usdin pulls the plug on his ALWAC III. Most of the machine will be scrapped, but he intends to keep the memory cabinet as a bookcase.

What do these beauties have in common?

Both of these WANGCO tape drives can read and write 800 cpi NRZI and 1600 cpi phase encoded tapes. You can select either industry standard format with the flick of a switch, or let the computer do it for you. And the same flexibility, at low cost, is available with all other WANGCO tape drive models.

If you're involved with COM, off-line printing, or a computer that requires transitions from NRZI to phase encoded formats, you'll want all the facts about the WANGCO D² Series.

WANGCO drives with the 800/1600 dual density capability may be daisy-chained with other WANGCO units, and WANGCO D² formatters are perfect running mates to make the job of interfacing quick and easy.

WANGCO D² tape drives, and other models, have a lot in common. Unparalleled mechanical and data reliability make them the first choice of the OEM and his customer.

We would like you to get together with our new dual-density data package. You will find that you have a lot in common.

Mod 1175 D² — Vacuum column drive with dual-density capability. Tape speeds of 25, 37.5, 45 and 75 ips. Self-loading vacuum chambers.

Mod 1045 D² — Servo arms, with dual-density feature. Tape speeds of 25, 37.5 and 45 ips. Automatic arm retraction for easy threading.

The Last ALWAC

didn't know it was a big deal."

Memory was a 4,096-word drum (8,192 words, optional), with 128 words of "fast-access" storage, provided by having two heads per track, and another 32 words of fast storage for constants. "We never needed a symbolic assembler," Gene says, "but we had a 32-word operating system."

One component lives on. The high-speed paper tape reader has been modified to read into the 704 replacement for the ALWAC.

Add and subtract time, as given in the sales brochure, was 1 to 9 milliseconds; multiply or divide, 17 to 25 msec. Flexowriter output was at 9 characters/second. Input was cards, paper tape, or keyboard. And there were 78 standard operations.

But Logistics Research was always accommodating about modifications: "they couldn't say no." Gene added five new commands, with the manufacturer's permission. Many other installations made major changes too. This led, Gene says, to "total incompatibility, because of their reasonable attitude. It must have generated terrific paperwork problems for them, trying to keep a current set of drawings for each machine installed. We wanted to add high-speed paper tape to our machine, and I wrote many letters . . . They felt our power supply was too weak to support any additional peripherals, but since they couldn't say no they just didn't answer the mail at all." But Southwestern got their paper tape reader, a Tally unit, with additional power from a war surplus Navy 24-volt unit.

The cooperative attitude of the manufacturer extended to spare parts. With a new machine, the customer got at least 10% additional pieces. To back up 50 flip-flops, he was given five spares. But, since there was only one clock read amplifier, he got one extra.

And the package included paint, a paintbrush, and paint remover.

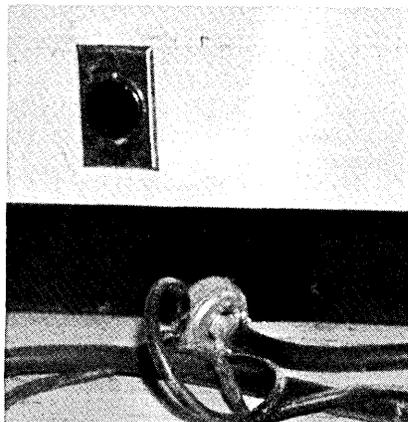

Gene made some special arrangements for input too.

"Since the paper tape code of the ALWAC was very unusual, we decided to prepare our tape by converting cards on an IBM 063. In order to do this, we had to modify the 063 internally in a very substantial way. This was pre consent decree, the 063 at that time was rented, and so we had to conceal the fact from IBM that we had

changed their machine. For a couple of years we did our own maintenance on the 063 because we were afraid that if we called a serviceman they would find out what we had done to their machine and scold us."

During the past 15 years, the ALWAC handled all of Southwestern's engineering applications. (Newer Burroughs equipment is used for business applications.) But the sinking spell convinced Gene that it was time to move up to later, more advanced equipment. And, at about the same time, he heard of a good machine for sale. So, by the end of last year, conversion was under way to his new scientific machine, an IBM 704.

Gene expects it to be cost-effective. He got it for \$1.

COMPUTER TALK . . . FOR COMPUTER USERS

DESIGN OF MAN-COMPUTER DIALOGUES by James Martin, IBM Systems Research Institute. A comprehensive guide to the design of man-machine dialogues for all categories of users. Offers a detailed examination of the many types of real-time, man-computer interfaces, especially for commercial management information systems. 1972 496 pp. cloth (013-201251-0) \$15.95

COMPUTER SIMULATION OF DYNAMIC SYSTEMS by R.J. Kochenburger, University of Connecticut, Storrs. Covering analog, digital and hybrid computer systems, this book is applicable to all fields of engineering. It introduces methods for developing computer models of dynamic physical systems. Teacher's Manual available. 1972 530 pp. cloth (013-166074-8) \$16.50

MANAGER'S GUIDE TO MANAGEMENT INFORMATION SYSTEMS by Robert V. Head, Information Systems Consultant. This book is dedicated to the application of computers in management and to the exploration of higher levels of computer principles and usage in business today. 1972 288 pp. cloth (013-548701-3) \$12.00

COMPUTER SECURITY MANAGEMENT by Dennis Van Tassel, Computer Center, University of California, Santa Cruz. An authoritative study of the problems of security in computer operation and procedure. Provides guidelines for implementing a complete security system for any computer center. 1972 220 pp. cloth (013-165464-0) \$10.50

Send me the books I have checked above for a free 15-day examination. Within the 15-day trial period, I'll either send you my check for the indicated amount or return the books and owe nothing.

Plug in the biggest and in the peripheral

Service is your most crucial concern in making a peripheral decision.

No matter how good a product . . .
No matter how attractive a price . . .
when service is unsatisfactory—all other benefits begin to disappear.

Today's EDP user insists on maximum system availability. Service, inevitably, is the great leveler of hardware companies.

TELEX is committed to service excellence—*above all*.

TELEX has built its success as *The Peripheral Company* by having *the* outstanding service organization in the industry.

This means that TELEX continues to invest millions in experienced, qualified technical personnel.

It means constant development of these service people through comprehensive schooling and in-depth training on all products.

It means an extensive logistics network and technical support organization—the local, regional and national teams of specialists—which reinforce the TELEX field engineer.

It means that TELEX provides the resources necessary to assure quick and effective response to *all* service requirements in all TELEX product categories—tape, disk, memory and printer subsystems.

Most of all—it means that you, the user, can depend on TELEX for service superiority.

You know it's most important.

TELEX knows it too.

You'll get the full story from your TELEX representative. Or, call or write . . .

Best service organization industry. TELEX.

The conference showed the technical excellence of Canadians, but at the show U.S. subsidiaries dominated the exhibits

Canadian Computer Show and Conference

by W. David Gardner,
New England Editor

Canada did its annual computer thing in the form of the Canadian Computer Show and the Canadian Computer Conference in Montreal recently and a brief walk between the two events told much about the dilemma that is facing—haunting, some might say—the Canadian computer industry.

At the Place Bonaventure where some 60 exhibitors had set up booths, there was one overwhelming impression about the Canadian computer industry: It's American. Most of the manufacturers exhibiting were subsidiaries of U.S. firms. Nearby, at the Queen Elizabeth Hotel where the Canadian Computer Conference was conducted, the first-rate technical program proved that Canadians don't have to take a back seat to anyone.

The contrast between the two events raised an obvious question: Why haven't the Canadians been more of a computer manufacturing force both within Canada and as an exporter?

Apparently a unique combination of relatively small population, entrepreneurial conservatism, some bad luck and a dash here and there of mismanagement have been largely responsible for the Canadian industry's difficulties. Add to this the universal boogeyman that everyone in the industry must face sooner or later—an exceptionally powerful indigenous IBM—and you have what would appear to be a bleak future for Canada nurturing its own sizable hardware or mainframe computer industry.

The keynote speaker at the Canadian Computer Conference, R. C. Scrivener, president of Bell Canada, said it is unlikely that there will be "a significant native mainframe industry in Canada." Scrivener, however, went on to propose some new and bold directions for the Canadian industry.

Pushing software

"It is in the software end of the business that the greatest opportunities and risks lie," said Scrivener. "If Canada is to develop its own software competence that can not only succeed against foreign competition but be capable enough to export its product into other markets, certain steps seem to be necessary.

"First, software skills should have professional status just as do engineering, accounting, legal and medical skills. Around the professionals and the academic base of their training would develop all the paraprofessional skills allied to software just as has been the case with the older established professions . . . If Canada took the lead in the world and created the process to develop an accredited software profession it would certainly gain a great advantage internationally and would attract to Canada outstanding people from other countries."

The speaker noted that Canada has the human resources, the educational system and the financial resources at hand, but he indicated that the financial resources should be diverted from hardware R & D into the software area.

In discussing another subject, Scrivener touched upon the proposed formation of a Canadian network of computer communications services. The speaker said it was his "guess" that a low cost network—with the chief computer installation based in Ontario—would be the route taken in the future. Such a network, he added, would provide "the greatest likelihood of developing east-west communications to offset the natural pull of connecting our terminals to computers south of the border."

Another speaker, Allan E. Gotlieb, Canada's deputy minister of communications, observed that a communications cable that will link Ottawa and Montreal initially and Toronto later, is currently being installed by the Bell Telephone Co. By 1980, London, Ontario, and Quebec City will be included in the loop.

The idea that Canadians can compete best in the software and services side of the computer industry was also voiced by George Fierheller, past president of the Canadian Information Processing Society who is also president of Systems Dimensions Ltd. (SDL) of Ottawa. SDL is involved in computer services and he had that field in mind when he said: "We can domestically compete on the manpower side rather than manufacturing. We're quite convinced that it's a continent market and not a country market. We

don't see that border."

SDL, which has some \$12 million worth of hardware including a Model 85, stresses turnaround and reliability. A company executive noted that more than 50% of the firm's jobs are turned around in less than 17 minutes. The company performs some 2,500 jobs a day, adding up to a current annual rate of \$6 million. SDL's services are marketed in the U.S. in Boston and New York City by EDP Resources and the company has plans to expand its services in the U.S.

One Canadian who has been practicing for eight years what many others were preaching in Montreal in June is Ian P. Sharp, president of I.P. Sharp Associates, an Ottawa-based software house. The firm, which employs some 70 people in North America, does nearly one-third of its business in the U.S. During the first quarter this year, Sharp Associates chalked up revenues of \$520,000 and a \$40,000 profit.

"I don't detect any vast differences between doing business in the States and in Canada," said Sharp in an interview. "I don't think the border should make any difference. It's largely in the minds of people. But it's the governmental bureaucracies on both sides of the border that can make life difficult."

In addition to his business in the U.S., Sharp has some 20 professionals working in Europe. When Ian Sharp founded his firm in 1964, he could raise only \$4,000 in venture capital, a fact that illustrates Canada's entrepreneurial conservatism. Profits and success spawned more success and five years later, in 1969, Sharp Associates raised \$1 million in private placement to finance its further growth.

Other Canadian companies have not been so fortunate.

Many had been looking to International Computers of Canada Ltd. (ICCL) to carry the mainframe banner in Canada and while the firm dominated the last Canadian Computer Show in Montreal in September, 1970, ICCL didn't even exhibit this year and, for all practical purposes, the company is in limbo. Its former president, James E. Bieser, is no longer with the company and independent observers of the Canadian computer scene have been able to pinpoint no more than 10 installed ICCL systems. ICCL appears to be waiting for a new Canadian charter from England's ICL—with which it has an affiliation. ICL has a new management team and many in Canada believe the U.K. managers must get settled before they will be able to turn

much attention to the Canadian affiliate.

ICL has already come to the rescue of another Canadian computer company, Ontario-based Consolidated Computer Inc., a data entry firm. ICL has agreed to purchase \$7 million worth of Consolidated's systems this year for sale in Europe and this arrangement was largely responsible for the Canadian company being able to announce its first profits at the Montreal show—\$177,121 on sales of \$2,073,874 during the first quarter of 1972.

"We're still on an austerity program," says William G. Hutchison, Consolidated's president. "But I think it's working. We've cut back our employment from 510 to 230. We still expect to do about \$10 million in business this year."

Consolidated was forced into receivership several months ago and in the process lost its president, Mers Kutt. Its chief market had been in the U.S., but the company has had to trim its sales force there down to five men. Besides ICL, the company was propped up by the Canadian and Ontario governments, which now own 54% of Consolidated.

"We're concentrating in more vertical markets now," says John M. Dennehy, Consolidated's director of marketing. "We're aiming at insurance companies and at state and regional governments. We've become very knowledgeable on state income taxes and have developed software and systems expertise in these areas."

Bad luck with minis

Another company that has lost its president is Datagen of Canada Ltd., the Canadian offspring of minicomputer manufacturer Data General. Juan A. Monaco has left as president and the company's original plans to design and manufacture a wide variety of products for export have been largely abandoned. But Datagen's arch rival in the minicomputer business, Digital Equipment of Canada Ltd., shipped its 1,000th computer from its Canadian plant during the Montreal show.

Meanwhile, the Canadian government continues to subsidize large U.S. mainframe companies in a move to encourage them to step up production and R & D in Canada. Control Data is the leading light here, followed closely by NCR and IBM. While these ventures appear to be successful, some Canadians have complained that the government subsidies have strengthened U.S. subsidiaries while too many of the Canadian firms that have received assistance have foundered.

One new Canadian firm that attracted considerable attention at the show was Comterm Ltd. of Montreal.

The company markets a family of programmable remote batch terminals—called the Series 2000—that can access a host of mainframe computers. Each system is configured around a PDP-11 and uses a variety of card readers and printers for the different models. The model capability ranges from 300 to 1200 cards and 300 to 1500 lines per minute with prices from \$40,000 to \$75,000.

"We've been marketing in Eastern Canada to establish a solid base," said Richard Shirley, marketing manager. "We plan to move into New England soon and then spread out across Canada."

As for the show itself, some 9,000 persons attended. Derek Tidd, show manager, said that while attendance was down from past years, the quality of attendees was high. "The trend is toward serious buyers of computer equipment and services," said Tidd. "The people were more interested in buying computers than those who attended the shows in the past."

The technical sessions at the Queen Elizabeth Hotel covered a broad range of subjects, from operating system design and pattern recognition to the status of the four-day work week and top management involvement with computers.

Two academicians, Andrew Grindley and Gordon Cumber of Western Ontario Univ., surveyed 65 senior executives at 42 corporations and found that none of the firms had a management information system in use. "With the exception of budget preparation, little use is being made of the computer for strategic planning purposes," they reported.

As for the four-day work week, David Alderman of P.S. Ross and Partners of Toronto estimated that some 50 Canadian firms have adopted the measure and he added that proponents claim that the four-day week has tended to bring about "higher output per man-hour." He said that the small number of firms that had reverted back to the traditional five-day work week after experimenting with the four-day week—about 10% of the firms, he indicated—did so largely because of poor and inadequate planning and scheduling.

Alderman responded to some criticism of the four-day week by stating: "Certain prominent behavioral psychologists have suggested that increased leisure time will in itself create problems—they believe that work is a basic need. My comment on this is that I am sure similar fears were expressed when it was suggested in mid-19th century Britain that society might generally be improved by reducing working hours of children in mines, or in fact taking them out of mines altogether." □

We'll take on any computer

Now you don't have to worry about service. Whether you're buying, selling, or interfacing a computer system, Raytheon Service Company can handle your service needs.

If you're a manufacturer, leave your servicing to us. Twenty-seven manufacturers have chosen Raytheon Service

Company to maintain their computers and systems.

Regardless of the make we can provide complete service. Our service network will let you do what you do best. Produce. And sell. We'll keep your equipment working in Macon or St. Louis or Seattle, or anywhere else.

If you're a computer user you

in the house.

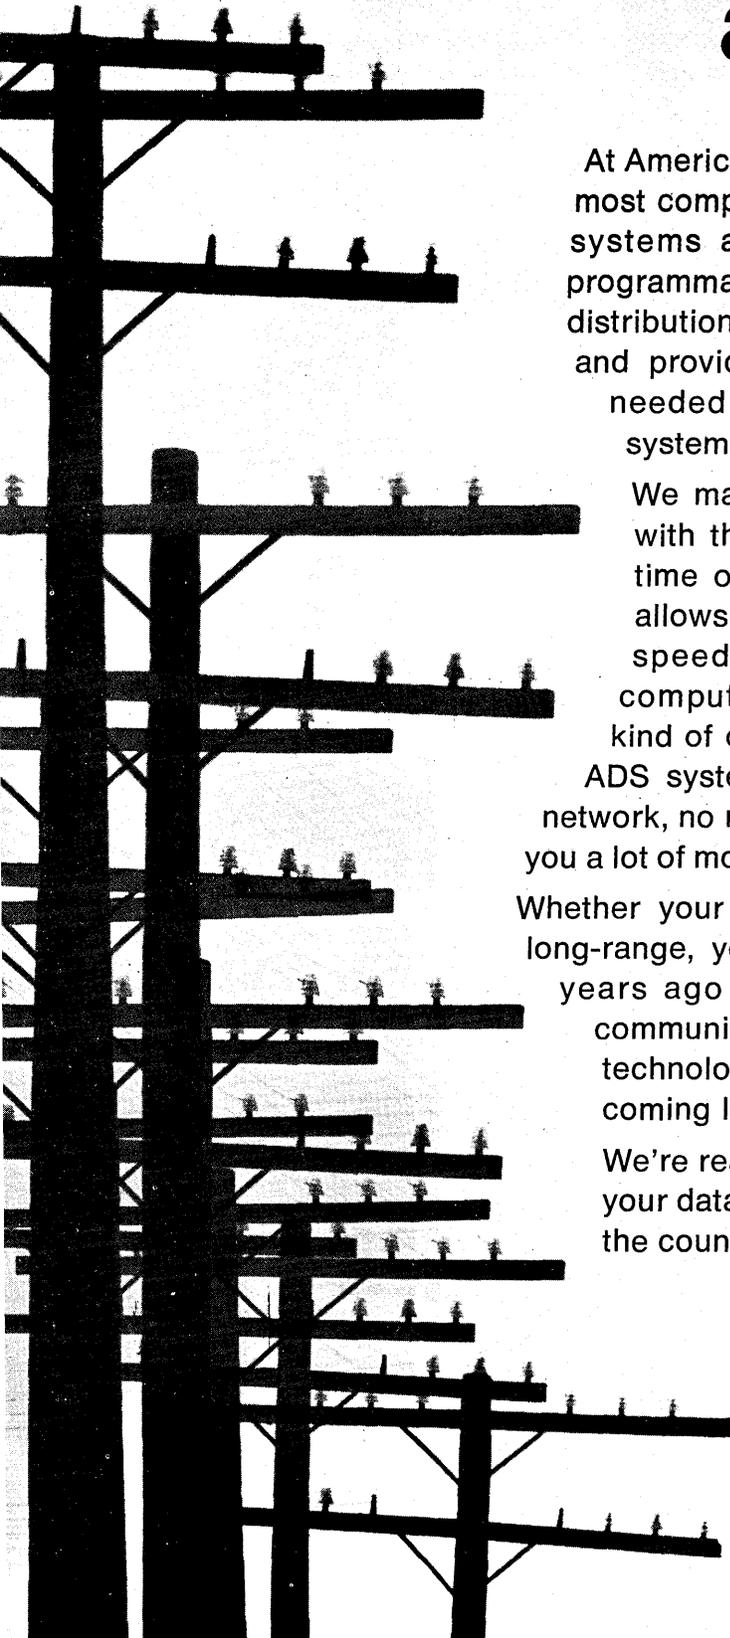

can go ahead and buy the special equipment that really provides the features you want. And you'll save money. Just be sure to buy equipment that's backed by a reliable service organization. Our service network is supporting a company that makes just what you need.

So remember our name. And

our specialty. Service. We'll take on any computer in the house. For more information, write our Marketing Manager or call us at 617-272-9300.

Raytheon Service Company,

Massachusetts 01803.

American Data Systems:

The company that speeds data around town, around the country, around the world.

At American Data Systems we make the most advanced and most complete line of data communications equipment and systems available. Data modems, data multiplexers, programmable data communications processors and data distribution systems. In fact, we make all of the hardware and provide all of the software and system engineering needed to put a sophisticated data communications system together.

We make small systems, large systems, even systems with their own computers (to take a lot of processing time off your main computer's back). ADS equipment allows computers to talk to computers, effectively, speedily. ADS equipment allows people to talk to computers with equal ease. It doesn't matter what kind of computers or terminals you have, nor how many. ADS systems can tie together any data communications network, no matter how modest, no matter how vast. And save you a lot of money in the process.

Whether your data communications needs are immediate or long-range, you should call on ADS. The company that five years ago threw away the book on conventional data communications concepts and came up with a whole new technology. Technology that has made us the up-and-coming leader in the industry.

We're ready to put that technology to work for you. To get your data moving faster and more efficiently. Around town, the country, or the world.

CSC and New York's Off-Track Betting: Pioneers Get Arrows

It all started April 1970 when New York State legalized off-track betting and New York City planned that its fiscal '71 budget would include a \$50 million profit from the new Off-Track Betting Corp. That's profits, not revenues — profits that had to be made by June 1971 from a company and a system that had not yet been designed or staffed.

As its appointed president, Howard Samuels, one-time Democratic nominee for New York governor and ex-executive of a plastics company, had to prove a great deal in this "unconscionably short time": that a city-owned corporation could seriously combat organized crime by competing with it, fill the public coffers, and satisfy man's sporting blood. It was a heady, but realistic goal. Estimates are that nationally racing, numbers, and sports could rake in \$10 billion yearly. New York City realized only a \$12 million profit last year, but it is now grossing at a \$300 million rate and with numbers and sports could reach \$2 billion annually, says Samuels.

Despite this apparent success, as he sees it, Samuels and company have been jumped on by political opponents like Gov. Rockefeller who don't want to

see a Democrat make OTB a success, by the tracks that didn't want to 'cut OTB in on the action, and by the nation's "hypocritical moralists." He has been thwarted by labor, the telephone company, Con Edison, and last, but not least, the propensity of the computer industry for being late.

If you've been reading the New York papers, Samuels and the vendor that won the computer contract, Computer Sciences Corp., did not form a lifetime friendship. In fact, "emotionally speaking," Samuels would like to "open the window and drop the software industry on its head."

Going back to that summer of '70, Computer Sciences was really the only reasonable bidder that committed to the Oct. 15 deadline for an initial operational system. (That was the only way to get the contract, says a CSC source.) It had the terminals left over from the defunct Computicket, some software (a DOS modification), and a very strong desire to become king of computer services for the future betting market — services that could go as high as \$500 million annually. But it did not meet its equally strong and continual promises to be up Oct. 15, Nov. 15,

The nation's first experiment in legalized off-track betting gave widespread exposure to the inadequacies of automation. But the basic problem was overwhelming.

Now there's a better way.

Your own low-cost HP data system.

Good management begins with making the right decisions. And making the right decisions begins with having the right information, any time you need it.

That's where we can help. We have some new data-based management systems that put information in the proper perspective. They are perfect for inventory control, cost estimating, order entry, file management, production scheduling. For all those jobs, in fact, that used to mean big system cost and complications.

Not any longer. You can now choose from a number of dedicated systems built around the HP 2100 minicomputer and some of our new peripherals. For larger, more complex applications, the HP 3000 is ideal. This powerful, flexible computer system handles batch, real-time and time-sharing all at once.

To make a long story short, we're in the data management business in a big way — and a small way.

We can help you become a more efficient manager for just about a thousand dollars per month.

And besides the hardware, peripherals and operational software, we also offer the services of computer specialists right in your own backyard. They're in the problem-solving business full time. So give your local HP man a call and find out how quickly he can get you the information you need. Or write for more data to Hewlett-Packard, 1501 Page Mill Road, Palo Alto, California 94304; Europe: P.O. Box 85, CH-1217 Meyrin 2, Geneva, Switzerland; Japan: YHP, 1-59-1, Yoyogi, Shibuya-Ku, Tokyo, 151.

HEWLETT  PACKARD

Jan. 4, and almost every week thereafter until cutover finally came June 15, 1971. And what went up, came down.

What's wrong?

Two years later, CSC executives admit to OTB that the system will not handle 1,100 terminals as promised. Inadequate restart procedures require up to eight hours to reconstruct the system (although the second cpu can begin handling transactions with an hour). Input errors can't be corrected once entry and verification are made, meaning that if a horse gets scratched by mistake, no correction can be made unless the system is taken down. System redundancy is inadequate. The latest software release, number 4, is eight months late. The system is able to handle more than half of the 500,000 transactions and \$1.5 million in daily bets, but the response is slow — 8-10 transactions a minute. Thus, Ticketron has been brought in to handle about half the 800 terminals installed. AmTote is doing the telephone betting (in which a bettor keeps a cash account) and was able to fill a CSC lack — immediate update of an account after a win or loss. The two additional vendors are costing an extra \$250,000 a month. To boot, the city has lost millions because it is not able to open offices quickly; 84 offices are open vs. over 100 planned.

CSC, which has managed to gross \$5 million for these services, seems now to be in a scrap for its OTB life — perhaps its life in the betting industry in general.

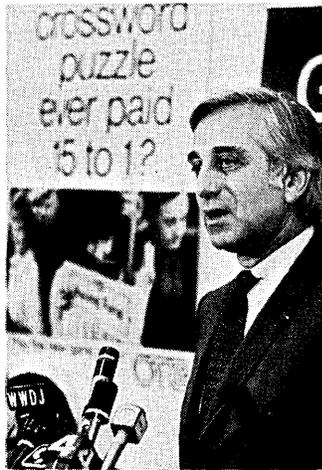

Computer Sciences' well-publicized inadequacies have been a big cause for the sniping criticisms of this nation's first experiment in legalized off-track betting. In all fairness, it has also been a victim of the same haste and pressure that beset OTB itself. The basic problem was overwhelming: How can one simultaneously design, test, and implement a high-volume, ever-changing, ever-growing, real-time system? And if you do what CSC did — use 360/50s, modify OS with BTAM (seldom used for such high-volume applications), and front-end the whole process with mini's (30 to date), the experts say you've really got troubles.

Not that late

Ed Brenman, director of the municipal data systems for the Bureau of the Budget (which had initial responsibility for OTB), counters that 10 months be-

tween selection and delivery is not bad, compared to, say, the 30 months it took Control Data to get an off-track betting system up in Australia. CDC, he adds, bid the OTB contract, but couldn't offer the terminal built for the Australian contract and wouldn't let Ticketron bid the system either.

If it was working on a pioneering system under impossible conditions, why then is CSC so criticized? Long overdue, OTB is finally this year under a new strong, dp management, led by executive vice president Jerry Paul, an ex-IBM marketer with much PARS and SABRE experience. Paul, who has a hardnosed attitude about the industry, emphasizes that his experience with CSC at IBM had been very good, so he came to OTB with a "positive attitude."

HOWARD SAMUELS; Drop the software industry on its head.

But what he found, he said bluntly, was the "typical industry case of alligator mouth and hummingbird ass." And he wonders about his seven letters to CSC president William Hoover that have not been answered.

Although no contracts have ever been signed, original agreements gave CSC the rights to the software, a cost-plus arrangement, and no penalty clauses. The payment has since been changed to a per-transaction one, eliminating the escalation software charges, and CSC has agreed to penalties for downtime. We asked Samuels why OTB gave up the software rights to CSC. He readily admitted that OTB was naive in the beginning. One source calls it a blessing. "Who wants software that smells like a 12-pound garlic soaked in diesel fuel?"

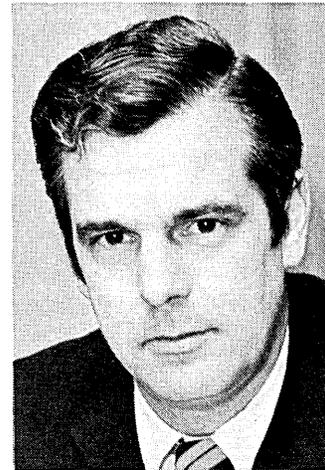

Thus the major criticisms against CSC seem to be broken promises and

a not-too-cooperative attitude by its management, plus a faulty design approach. The system was generated under pressure, but still, two years later, is uncorrected to satisfaction.

We tried to piece together an objective story. But under orders from Mr. Hoover, CSC, which strongly feels that it has been treated shabbily and with bias by the press, would not give *Datamation* its perspective technically or otherwise. So, we talked to OTB, ex-CSC personnel on the project, Brenman, and other vendors.

From the beginning

Though the Bureau of the Budget had been studying off-track betting for a dozen years before the law was passed, all that was really ready when the request for proposal went out were the specifications themselves. That August, Charles Chriss, a computer

JERRY PAUL: His "positive attitude" soon changed.

professional with a programming background and two stints as an entrepreneur, joined OTB to handle operations in an organization that now totals 2,000 people and 84 branch offices. He was shocked to find that though the computer vendor, CSC, had been selected, nothing had been done on operations. His tasks ranged from defining betting and track interface procedures, protecting against fraud and theft, establishing a financial system, and hiring — to selecting durable furniture and wallpaper that would stand up in heavy traffic.

Chriss says the first big snafu that affected the whole operation came that fall. OTB had planned to list only 12 horses per race and to open up for betting at 7:30 or 8:00 a.m. It discovered that the daily scratches weren't made by the tracks until later in the morning, and at 7:30 there might be as many as

Our standard data terminal is "special" for your system because...

It's modular. We can supply it ready to talk to your system's computer in the interface, hand shaking and code format you need. It's adaptable to practically any information system for production monitoring, medical data, machine loading, time and attendance reporting.

It's flexible. Choose from a broad range of options:

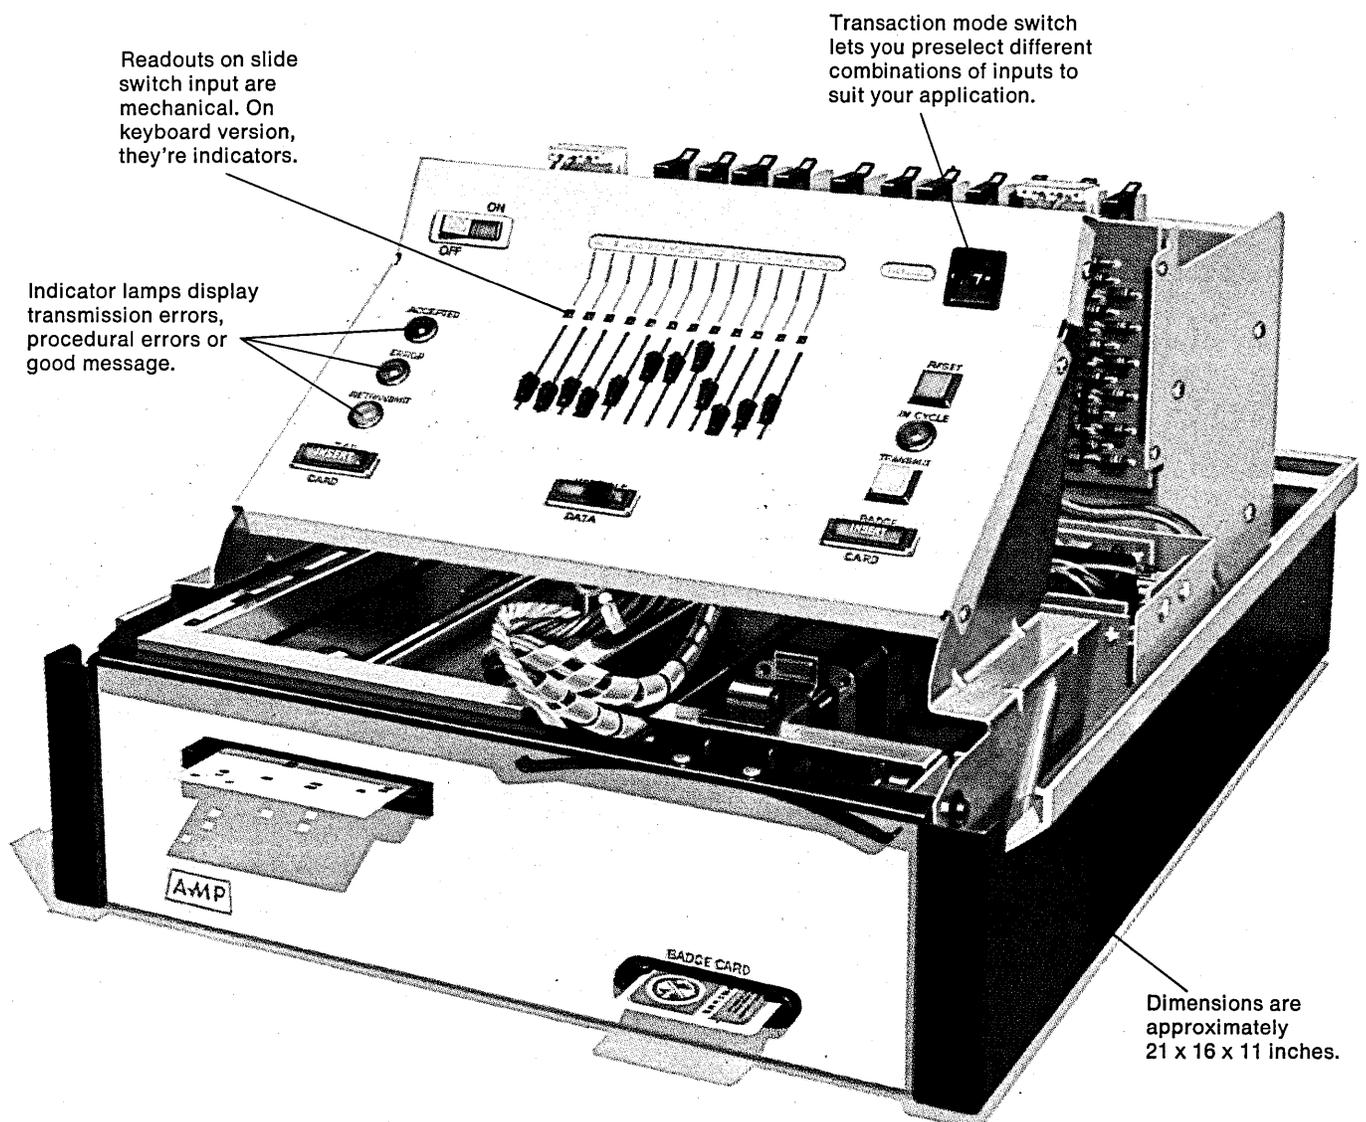

- 12 or 16 character slide switch or keyboard entry.
- field changeable transmission ranges, 110 to 1200 baud.
- output interfaces: differential line drivers, TTY current drivers, RS-232C, internal or external modems.

- accepts tab cards, punched badges.
- converts to ASCII code, TTY format, or other codes.
- for transmission over 2-wire multidrop, in either polled networks or dedicated lines.

It's economical. For complete details on our 1200JC series Data Terminals, write to: **AMP Incorporated, Industrial Division, Harrisburg, Pa. 17105**

AMP INCORPORATED

Manufacturing and direct sales facilities worldwide: Barcelona, Brussels, Buenos Aires, Frankfurt, London, Mexico City, Paris, Puerto Rico, Sao Paulo, s'Hertogenbosch (Holland), Sydney, Stockholm, Tokyo, Toronto, Turin, Vienna.

When the job is too big for DEC and your budget is too small for IBM, then the answer is the new **DATA-CRAFT** DC 6024/5 for \$10,900

The new Datacraft DC 6024/5 is aimed at the existing price/performance gap in our industry. Use the new DC 6024/5 to keep from being squeezed into a 16-bit mini or pushed into an expensive 32-bit machine.

For performance we gave the DC 6024/5 our standard 24-bit word length. This means you can directly address 32K words or indirect up to 65K words. Try that with any mini computer and you will see why 24 bits is the optimum word length.

For \$10,900 you get a computer that matches the input/output capabilities of systems costing many times more. The I/O structure of the DC 6024/5 combines the

economy you want in unit I/O systems with the speed of channel I/O systems: full parallel binary arithmetic; single address, multi-access bus structure; fully buffered I/O channels with shared peripheral units; and multiple CPU capacity.

Compare these standard instructions:

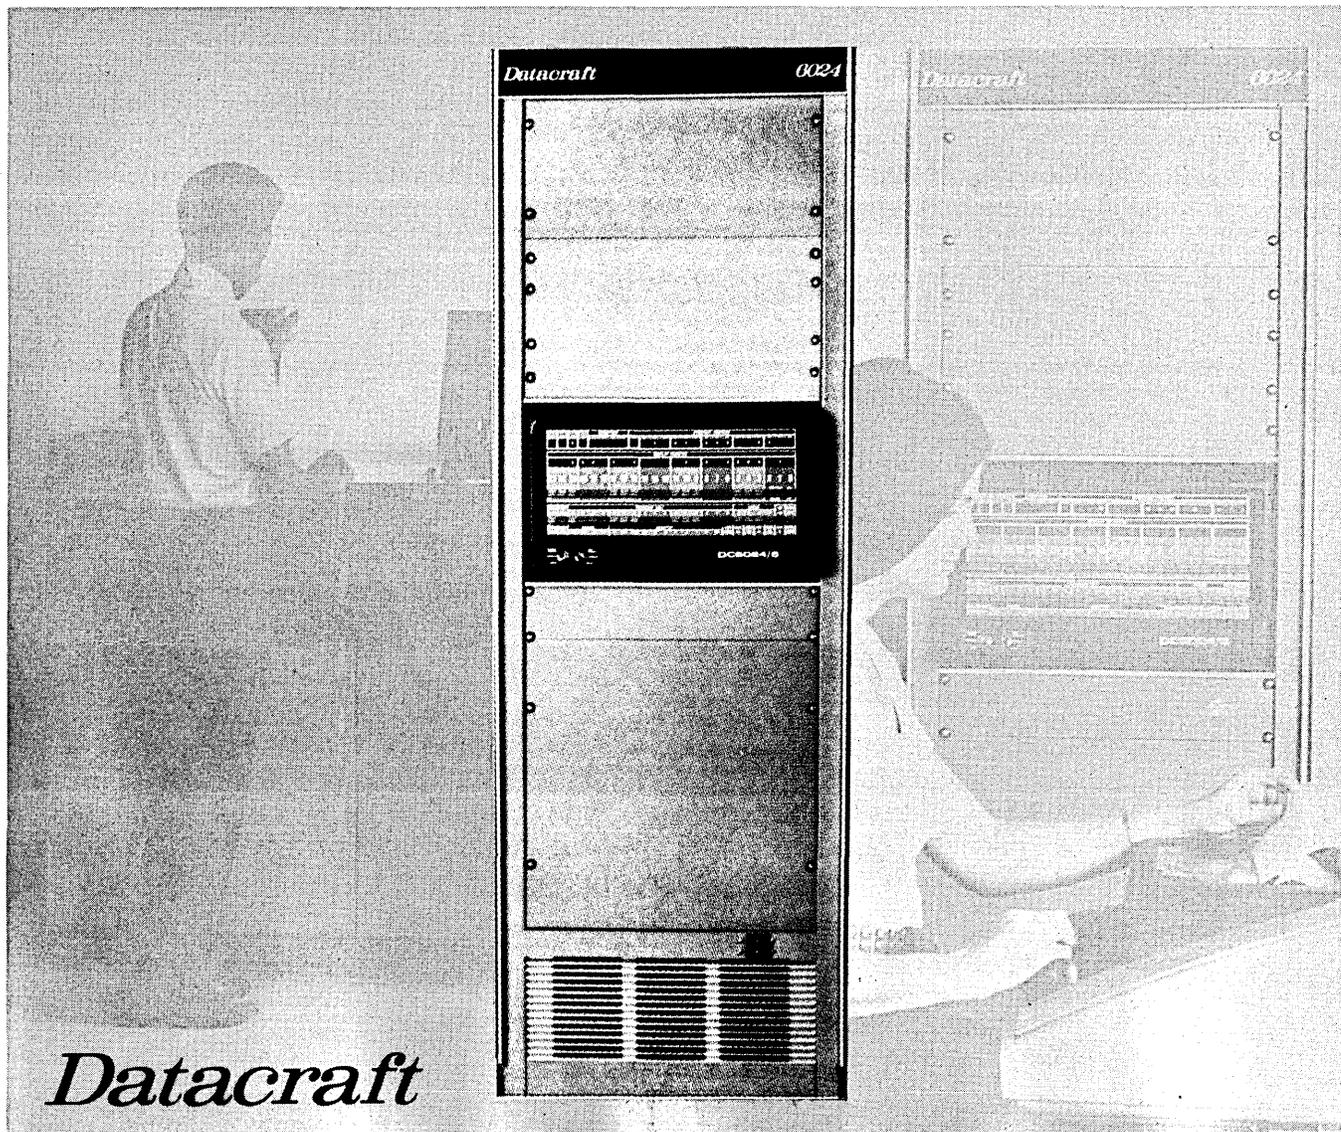

INSTRUCTION	EXECUTION TIME
Add/Subtract.....	2.0 microseconds
Multiply.....	8.0 microseconds
Divide.....	15.0 microseconds
Square Root.....	14.0 microseconds

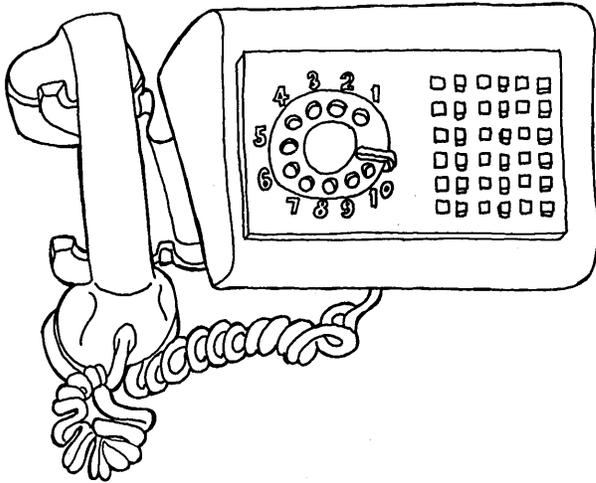

The Datacraft product philosophy is to have all computer models software and I/O compatible. This means the software systems

for the new DC 6024/5 have more than three years of field-proven experience. Peripherals ditto.

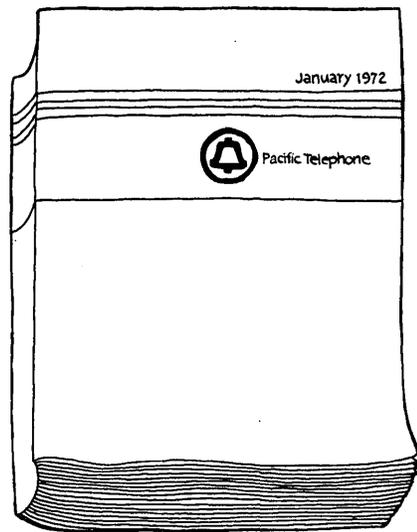

OEM or end-user applications — prove to yourself the price/performance advantages of the new Datacraft DC 6024/5. Write for your free copy of the "Datacraft 6024/5 Discovery Kit." The kit contains specifications, prices, performance information, and typical configurations that show just how much machine you are getting for only \$10,900.

Write for: DC 6024/5 Discovery Kit, Rm 201, Datacraft Corporation, Post Office Box 23550, Fort Lauderdale, Florida 33307.

If you want to
find the right
number fast...

You need the
latest phone
book.

If you want to find the right computer
product or service fast...

You need the new 1972 EDP Industry
Directory from Datamation®.

You can save time — because we've used the speed and logic of a computer to sort and index the information for you. So you can find what you want fast, from over 20,000 offerings by 2,500 vendors.

The listings are compact — and they show clearly the key information, with prices, maintenance costs, compatibility features, languages... just what you need to know to make sense of the bewildering variety in the marketplace. And every product listing is cross-referenced to a vendor index — so you can check out the company facilities and service.

Remember, hundreds of vendors have dropped out since the last edition was published — including RCA — and hundreds of others have checked in. So get your own personal copy of the new directory. Send a check or company purchase order for \$25,* along with your name, title, and mailing address, to 1972 EDP Industry Directory, Technical Publishing Co., 1301 S. Grove Ave., Barrington, Ill. 60010.

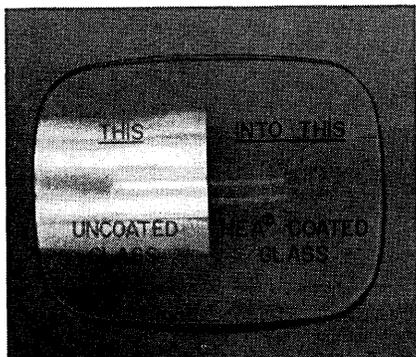

**In the U.S. and Canada; \$35 elsewhere.*

Are Ghost Images Confusing Your Customers' View?

Blurring the signals on oscilloscopes? Dimming the images on TV monitors or radar displays? Obscuring the data on computer terminal displays? Do your customers have to look twice at any of your cathode ray tube display devices to get the proper information?

Let OCLI Help You Clear Things Up!

HEA®—a high efficiency multilayer antireflection coating—reduces reflections over the visible range of the spectrum by a factor of 10 over uncoated glass. Deposited directly on the curved surface of a CRT or its faceplate, HEA will transform

(unretouched photograph)

The coating can be deposited on either acrylic or glass, is extremely durable and can be cleaned and handled with a minimum of care.

HEA for Display Devices is only one of OCLI's large family of HEA coatings designed to improve the view through nearly every type of visual optical system. Find out more about how OCLI can brighten images. Write to our Marketing Department, Technical Products Division.

news in perspective

24 entries still listed. The system therefore had to handle not 12 but 24 horses, or critical early morning rush-hour revenue would be lost. That decision affected the files, the programming, and the terminals, which were then being manufactured with 12 keys for horse entry.

CSC might have had its first inkling of how volatile the new effort would be, but it insisted, we're told, that it could be up by Nov. 15 (a month delay was actually caused by track and legal problems). In the meantime, CSC and the city's technical committee dickered over the features that would be in the initial system, and according to an ex-CSCer on the project, what they agreed upon "doubled the amount of software that would have to be developed." Nov. 15 slipped to Jan. 4. This source says that the technical staff never committed to any of those early dates, although Jan. 4 might have been made if those additional features weren't required.

This ex-CSCer also said that modifying OS with BTAM was planned as an interim step. "We had to work with something available to get up in time." The CSC staff was developing its own scheduling and job control programs, using OS only for I/O handling. The plan was to gradually replace the whole system with custom-tailored software, much the same as the industry has seen IBM do with reservation systems like PARS.

He "chickened out"

By December, Chuck Chriss was getting skittish because some branch management staff had been hired for the Jan. 4 cutover (just a few offices were to be opened), and there was no system to be tested. CSC kept saying "everything's under control"; but the month wore on, and when CSC's marketer on the project appeared before the Board of Directors to speak the truth, our source says "he chickened out, optimistic until the end."

CSC didn't make it and promised from week to week that the system was coming. Because of this, OTB procrastinated on whether to go to a manual system. With multiple vendors involved — IBM, the phone company, Wiley (terminal manufacturer), and CSC — it became a cry of "bug, bug, whose fault is the bug." Our ex-CSC source says that the real problem in January and February was a change in technical management. As previously agreed,

Dr. Wayne Swift left for another project and his replacement's talents "cost the project three months." Management "didn't admit soon enough it had made the wrong decision."

Generally, this source sums up the problem as two-headed monsters on both sides: On CSC's side, the technical management reported to the Systems Div., and the marketing management fell under the new Custom Systems Division; on the city's side, the Budget Bureau was still partially in control, but OTB management was taking hold. So, he says, there were orders and opinions from four sides.

Everyone agrees on one thing — that the CSC technical crew worked their hearts out, sleeping on floors and cots and spending New Year's Eve at Nathan's hot dog stand. With each passing week of delays, all were painted with the same brush, maligned by the press, and blamed by all. Off-Track Betting Corp. personnel, out of sheer frustration, began visiting the CSC quarters with great frequency, demanding, blaming. Computer Sciences executives in California began to hit the panic button, calling the marketing manager on the project, who in turn called the technical staff — many times daily. Morale crumbled. And the constant turnover in staff may have led to the kludge that resulted.

Time fled, and by spring, OTB had decided to go to a manual system. CSC made one final effort in early April to stave that off, but its demonstration before the board failed — "catastrophically, as only a computer can make you fail."

The bettors couldn't have cared less whether a computer was involved; in fact, manual ticketing is faster. But OTB needed the computer to store and consolidate the betting for the tracks, protect against fraud (through personnel and other checks), track and corroborate the winning tickets, and develop reports on revenues for all who would get a cut — the tracks, the state, the city.

The system did go up June 15, though without being duplexed and lacking many features originally agreed to (no contracts have been signed). But it was better than nothing. Through a pitiable catastrophe, CSC's shaky reputation was jolted again within a few weeks, when the system went out for eight days in July. In testing, a programmer had wiped out their whole produc-

tion system; and because they didn't have a backup, they had to construct it from earlier versions and the memory of the staff.

In the meantime, Ticketron had watched the troubles and quietly developed a modified system that they offered and brought up within 45 days — making CSC appear a bigger goat than perhaps it was. The system, which is currently handling as many terminals (about 400), though not the same volume as CSC, is — in marked contrast — based on the smaller CDC 1700s. It doesn't have as much power as the 50s but it is duplexed, has a quicker restart, and initially provided markedly higher reliability than the CSC system.

Why not minis?

All those who felt that the OTB system could have been done on minis with big storage space began to point knowingly at the Ticketron, and subsequently the AmTote system, which is based on dual Varian 620/i's. AmTote handles only 60 terminals, but one system developer opined that it could handle the whole OTB system on dual 620s front-ended by two more such minis and supported by more storage. We did ask CSC why they hadn't at least tried minicomputers as an interim system; but, as noted, they wouldn't discuss it. One ex-CSCer commented that he thought New York was anxious to use IBM 360s because of its giant cache of 360s that could be used for backup; and "going from 50s to minis would have looked bad."

In any case, the CSC system is still suffering reliability problems and has a software approach that a technical manager says has become a kludge and should probably be restarted from scratch. He adds pityingly that some problems weren't CSC's fault: "Last December, everything on the system, which had been worked 24 hours a day, decided to go haywire." At writing, he said that Ticketron, which had amassed a good reliability record, was suffering the same and, according to Brenman, had stopped adding terminals to its system. "The bettors only know what terminal is working, and while they used to line up at Ticketron terminals (which are used in many of the same offices with CSC's), they've been going to CSC's lately."

So today, the three vendors are scrapping for what may become a one-vendor shop. If Ticketron or AmTote are winners, they should be in a good position to capture future systems

around the country. About 14 states are studying or have legislation on off-track betting. New York itself, which won't allow most of its counties to link into OTB in the city ("for sheer political reasons," say Samuels) should have some kind of regional plan to cover the state by next year. Samuels thinks that legislation legalizing sports and numbers betting may be passed before 1975. In the meantime, he continues to fight off the tracks and the state, both of which want a bigger cut of the OTB revenues and are battling televising races. He's battling the nation's "hypocrisy" in opposing more legalized betting while leaving the riches to organized crime. And he's trying to get Off-Track Betting Corp. into shape to be the model of a fully automated, highly profitable corporation "to show that the government can run something successfully."

Several of OTB's offices are run by ex-addicts and the handicapped — just 1½-2% of the staff, but "just think if all corporations did that," Samuels muses, his mind moving rather quickly from computer problems to betting to the social problems he expects to tackle when he leaves OTB for some appointed or elected office in the next year or two.

And CSC is left wincing over the adage: "Pioneers get little but arrows in the derriere."

—Angeline Pantages

Peripherals

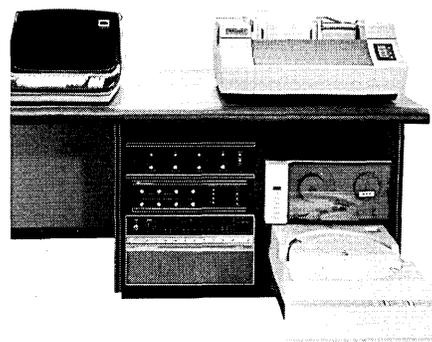

Will Independents Survive IBM Move?

Physics students studying lenses and mirrors learn that a "virtual image" is an image of something that is not there. In many ways, IBM's August announcement was not all that it appeared to be.

With its virtual storage architecture and operating systems, IBM was announcing "an advanced technique that can significantly speed and simplify the development of many computer applications." What it didn't announce — and what competitors claim is very much part of the Aug. 2 releases — was a return in some ways to bundled pricing.

In its court action seeking to constrain IBM from making its announcement, Telex Corp. claimed the announcement would damage its ability to compete with IBM in supplying add-on memory and 3330-like disc drives. Telex refused to comment after the announcement, noting that the merits of its case were to

If you'd like a disk system, but just don't have the space . . . let Xebec get it together for you.

We sell more computer peripherals than anyone except the mainframe manufacturer himself. That's because we put them together to suit each customer's special needs.

Even if you're short on space, we can put together a top-loading, low-profile disk system that's ONLY 8-3/4" high, meets your requirements, and interfaces with the mini-computer you now have.

We can get you 5 million 8-bit byte storage per drive (up to 4 drives can be daisy-chained to one controller). Our disk drive features head positioning using a voice coil and optical positioning techniques.

In fact, we can even put together your extensive supporting software.

So, if you can't get your disk system together in the space you have, fill out and return the coupon below. We'll do it for you.

- Please rush me more information on your XMD 7224.
- Have a salesman stop in to discuss my special requirements.

Xebec Systems — The Company That Puts It All Together. 566 San Xavier Avenue, Sunnyvale, CA 94086.

CIRCLE 109 ON READER CARD

What the industry taught us about cheap OEM minicomputers.

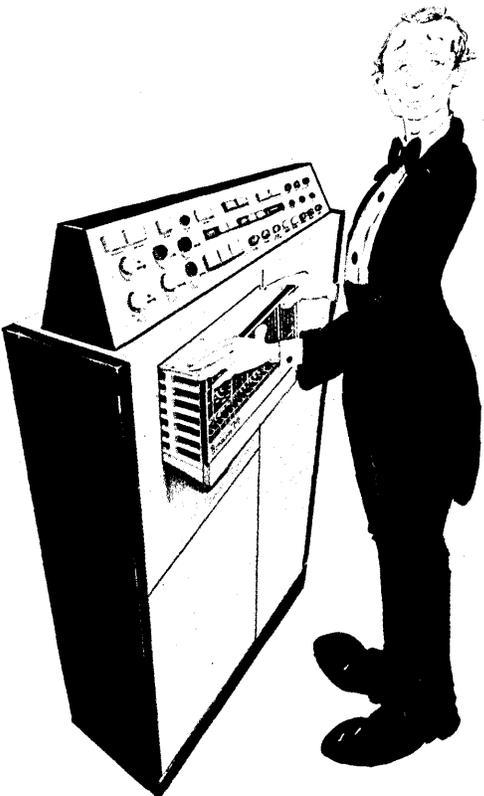

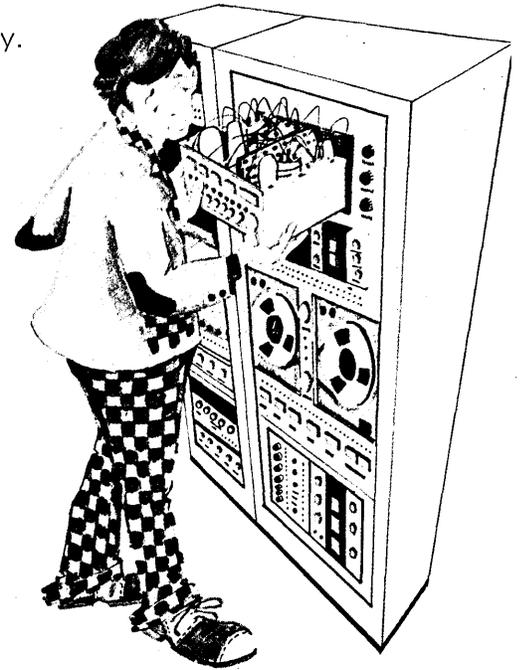

Stripped for action.

Here's a familiar approach. El Cheapo II. In reality, it's the good old Mod X stripped of all the stuff that made the old Mod X good. Instructions. Memory. I/O facilities. Everything. But it's cheap. It's really cheap. Only the hum remains.

Dressed to kill.

Here's the same machine in disguise. Now it's hiding behind all the things you have to hang on it to make it work. Like a power supply and a memory and some sort of I/O kluge so your system can talk to it.

Also hidden, of course, is the cost. And it isn't so cheap any more.

Introducing the \$3600 Interdata Model 74. What you need is what you get.

Here's a new approach.

A \$3600* general-purpose OEM minicomputer with the much-copied third generation architecture of the Interdata New Series family of minicomputers.

And that \$3600 — lowest in its class — includes hardware multiply/divide, 16 general registers, directly addressable 8KB core expandable to 64KB, an 80-ns solid-state Read-Only-Memory and a multiplexor that provides an I/O system for communicating with up to 255 peripheral-oriented device controllers.

We've even made the display panel optional because most OEMs don't need it. And what you need is what you get.

At \$3600, maybe we'll teach the industry a thing or two.

**INTERDATA®**

news in perspective

be heard in Federal Court in St. Paul Sept. 11. Coincidentally, one of Telex' former directors, James L. Quick, sold all of his 12,700 shares right after the announcement.

Some memory suppliers claim that in reducing the price of the memory offered on the new machines and compensating for this by raising the prices of its new central processors IBM may be cutting memory prices artificially. "If that is not restraint of trade, I have never seen anything that was," said the vice president of a large-volume core memory firm who asked not to be identified. He said core makers would be hard put to justify the heavy expenditures of going into the semiconductor memory business if IBM's price umbrella were lowered below profitability levels.

Robert Lloyd, president of Advanced Memory Systems, the Sunnyvale, Calif., firm which sells semiconductor memory add-ons through Intel Corp., figures that IBM's new MOS semiconductor memory should have been offered at a price 20% lower than core. Instead, it is 50% lower.

Also hurting independent suppliers is that fact that the minimum memory IBM offers on the new machines is double that offered on 155s and 165s. Lloyd said this has the effect of slicing off from 25-30% of the independents' potential main-memory replacement market.

Stuart Lotwin, president of Data Recall Corp., which has some 300 installations of main-memory replacements and add-ons across IBM's 360 and 370 lines, doesn't think his firm will be seriously affected. There is lots of business left in the 360/65 and 370/145 market, Lotwin said, adding that his company had planned soon to begin offering semiconductor memories for the 135 and 145 lines anyway, and also was considering entering the 158 and 168 add-on market.

In integrating more electronics into the central processor, IBM has reduced the number and complexity of devices open to competitive selling. "Integrating," in this context, is very close to "bundling" because it cuts the market for independently manufactured disc and printer controllers. IBM continued the practice with its development of the integrated storage controller for the 3330 disc drive.

James Pyle, spokesman for California Computer Products, thinks there

still is a healthy market for his company's 3330-like equipment. He said the IBM move "doesn't kill the market, but it does cut the size of it down drastically. We'll be able to stay in the market, but I think some of the smaller people may not." Pyle says the estimated 3,000 IBM 3330s already installed represent a pretty good replacement market in itself. "Even with the current price cut, we can stay at least 10% under their price and still make a good profit." Neither Pyle or any other suppliers will admit they're certain this is IBM's final price reduction.

Meanwhile, Intel Corp. said the pricing differences will put it out of the operating lease business on 370 memories, unless they are part of "package" deals the firm has been offering. Says Gary B. Friedman, president of Intel's data processing group: "A 512K memory used to rent for approximately \$6K a month. Now it's \$2600. On a \$6K deal, we could save the user about \$1000 a month. Now we can't rent it to him for, say, \$1500 and make a profit on an operating lease basis. We think we can, however, on a package lease basis."

Twelve days after the IBM announcement, Telex began advertising savings to users through package deals offered by its newly formed leasing operation in Phoenix. It said that by leasing IBM 155s and 165s and using Telex memory, discs, printers, and controllers, a customer could use the benefits of virtual storage immediately and still save 30% on a 158-like configuration and 26% on a 168.

Intel's Friedman says IBM's strategy is "to get themselves into a position where no one can impact their rental base." In the long run, Friedman adds, the user is the loser. "We can save the user money over any IBM plan, but now we can't save him as much as before."

Edward Farris, vp of the Electronic Memories Group at EM&M, said "any time a user becomes a captive of IBM, he is put into an undesirable position. The 158 and 168 announcement does seem to be intended to produce a captive state for the 360 and 370 customer."

As for customer reaction, it might have been best put by William Payne, assistant director of administration and computer services at Lockheed in Burbank. Payne did not expect an immediate impact as a user, but one that would be felt 15 years from now. "If all those

Let Xebec put your MTU together . . . nearly everybody else does.

Xebec's magnetic tape unit subsystem is one of the most versatile on the market. Its on-line drive can be controlled from any of the top mini-computers available today. It can handle from one to four units with 7 and/or 9 tracks. It can operate at speeds from 12 to 75 ips at densities of 200, 556, and 800 BPI. It even has the capability to pack or unpack 12 or 16 bit words. And, incidentally, our MTU comes with forward and reverse read of records and files.

No wonder, we sell more computer peripherals than anyone except the main-frame manufacturer himself.

And, if that isn't enough, our MTU is available with many more machine instructions, instruction modifiers, status, and interrupts. The Xebec MTU is even compatible with IBM formats.

Now, if you're still not sure why almost everybody gets their MTU from Xebec, fill out and return the coupon below. We'll show you.

- Rush me more information on your MTU today.

small companies go out of business, there will be no reason for IBM to make announcements like this," Payne said.

International

Virtual Storage an Interim Step

Large European users in general are pleased with what large-scale virtual memory will afford them.

But in interviews a week after IBM's announcement of the new 370 systems, they complained that the requirements of the VS2 operating system for three megabytes of virtual storage are "overwhelming," and "in the unfortunate tradition of IBM software." Most concur that virtual storage is just an interim step until IBM can bring semiconductor storage costs down to replace it with real memory. In the meantime, virtual storage encourages big programs and less attention to efficiency.

Because of the low costs of programmers relative to hardware, Europeans have always emphasized efficiency more than their U.S. counterparts. Thus, they are not too pleased with the IBM encouragement of "bigness" in programming. They do, however, feel that as programming salaries go up — a trend in many countries — and hardware costs come down, they too may be swept along by the IBM approach.

Multinational users see another side to the announcement. Always plagued in the past by the need to maintain two operating systems — DOS in their smaller centers and OS with big 360s and 370s — they are particularly pleased by the program transferability offered by the new operating systems.

Other factors enter in, too. For instance, although leasing has become increasingly popular in major user-nations (Leasco Europa has recently placed \$24 million worth of machines), sources estimate there are several hundred purchased 155s and 165s. The value of these systems has, of course, been depreciated. Switzerland, with a tradition of buying 80% of its equipment, should be the hardest hit.

Opinion varies on what will happen to the independent memory and peripheral makers or marketeers. Although mixing installations is not common in research and university environments in

Europe, it had gathered speed among commercial users. Now, except for the likes of BASF, Europe is not expected to spawn any indigenous manufacturers of plug-compatibles.

Even mainframe manufacturers are worried. In fact, some panic has been created in firms like ICL, which had already seen its stock plummet to a value equivalent to about one-third of its gross annual sales. The company's valuation on share price is about \$140 million, and its real estate holdings alone are said to be worth several times that amount. European users had already been eyeing IBM because of its PL/1 package, which has a much wider appeal there than in the U.S. Virtual storage just might add enough to that appeal to get some customers to switch from machines like the ICL 1900 (for which IBM has emulators) and the byte-oriented ICL System 4 and Siemens 4004.

Many European users are amused by the IBM introduction of paging "almost as if it was the first time," chuckling that the Atlas computer had that capability in 1960, "by chance a European invention." Then, as everyone does, they mused about the Burroughs 5000.

Antitrust

Trip to the Cape Didn't Come Off

The transcript of the Justice Dept.'s antitrust case against IBM contains a statement that an attorney representing IBM threatened to go to President Richard Nixon to "obtain clearance" for representatives of the court, IBM, and the Justice Dept. to visit NASA computer installations at Cape Kennedy and Houston during a moon shot.

The trip had been proposed by attorney Thomas D. Barr, who, according to the statement in the transcript, became "truculent" when the trip was canceled by the government. Barr represents IBM in the case.

The statement was made by Judge David N. Edelstein, who is presiding over pretrial proceedings in U.S. District Court in New York. In his statement, Judge Edelstein referred also to Justice Dept. attorney Raymond M. Carlson. The judge said: "Mr. Carlson

related that Mr. Barr's attitude after his last conversation was truculent. Mr. Barr indicated that he would (go) to the President if necessary to obtain clearance."

Both Mr. Barr and Mr. Carlson were in court when the judge made his statement about the planned moon-shot trip, and neither made any comment on the statement about the President. There is no evidence to suggest that Mr. Barr ever attempted to contact the President.

Both IBM and the Justice Dept. were contacted by *Datamation* and each refused comment, citing a court order that forbids them from discussing the antitrust case with the press. The unusual court order was proposed by IBM, prepared jointly by IBM and Justice Dept. attorneys and signed by Judge Edelstein. Reporters covering the case are thus restricted to working from what selections of the proceedings are available in the federal courthouse in New York.

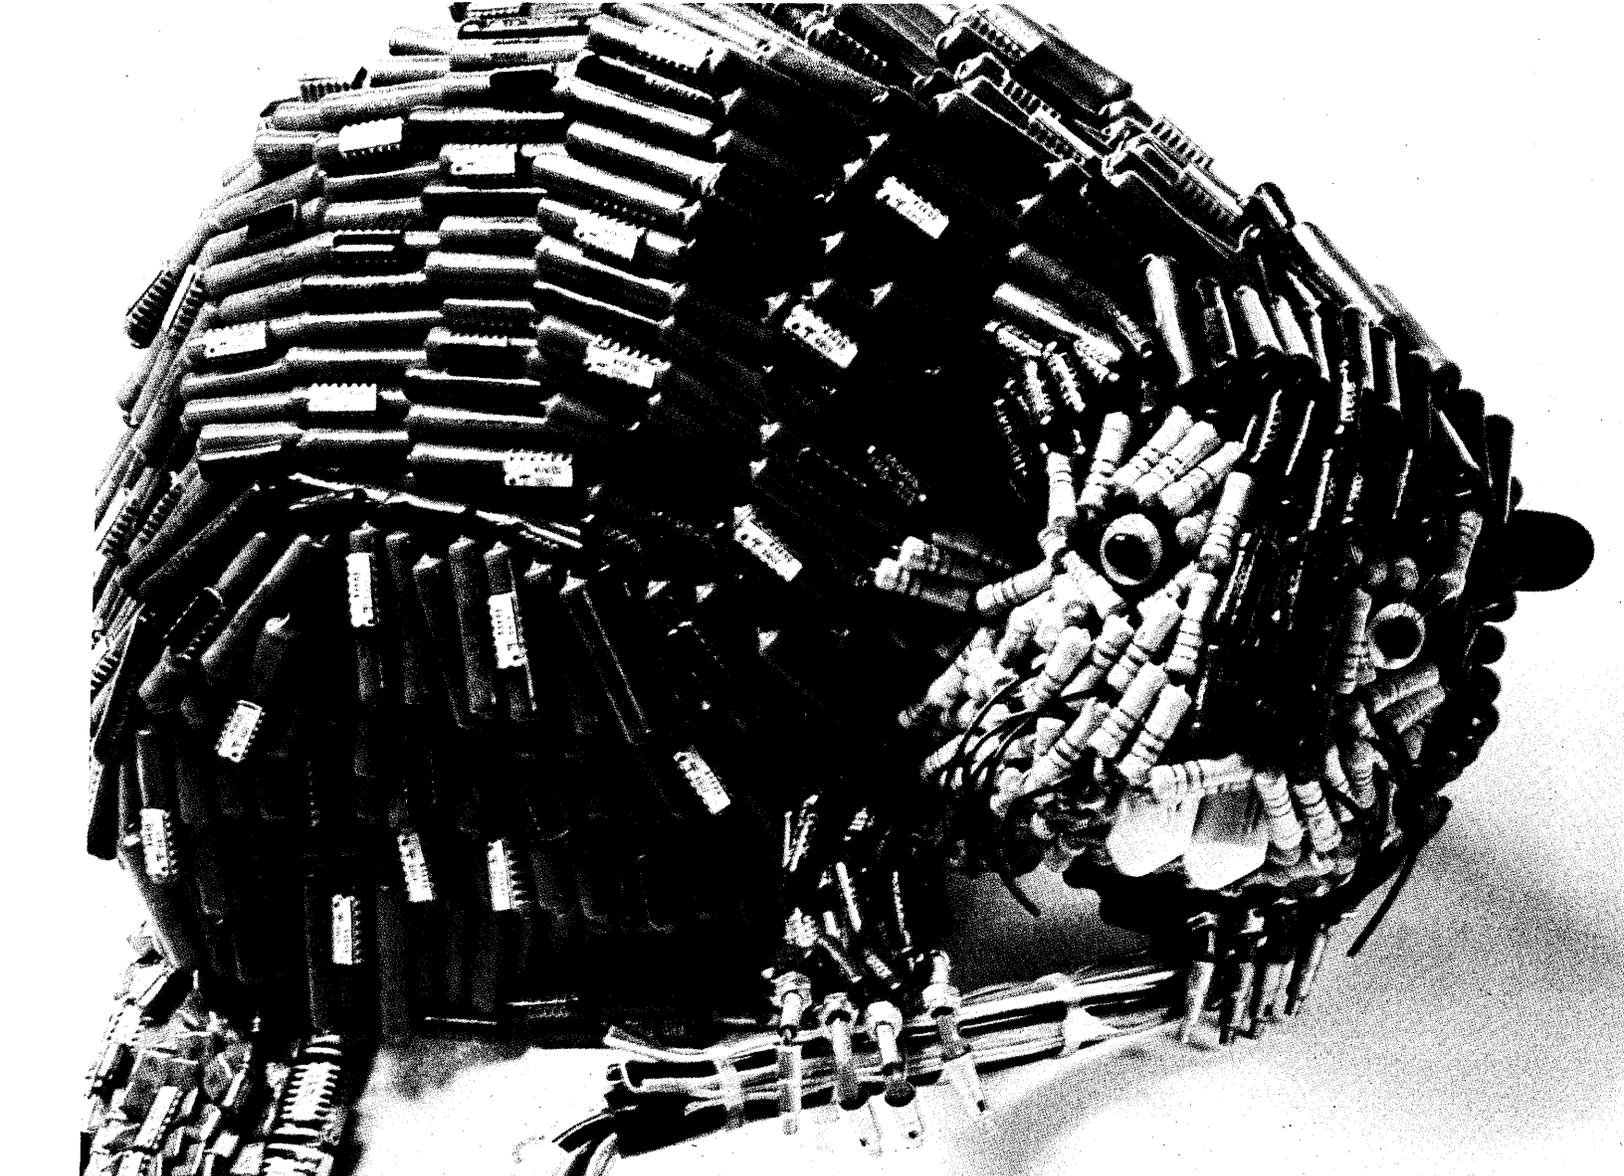

"Excellent" suggestion

In February, Mr. Barr proposed that the court visit the Cape Kennedy computer installation, and his associate, attorney F.A.O. Schwarz, observed that there would be a space shot there in April. The idea seemed to appeal to Judge Edelstein immediately. "I think your suggestion to view this scene is an excellent one," he said.

However, Mr. Carlson, the Justice Dept. attorney, appeared at first to express some hesitation at the IBM suggestion. He said: "I would love to go, but I wouldn't want Your Honor to take this as any indication that I think the (sic) Cape Kennedy has anything to do with this case or the tracking of missiles has anything to do with the case."

Mr. Barr's reason for suggesting the trip was, he said, that he was having difficulty in explaining what was involved in electronic data processing and that a trip to a sophisticated computer installation like the one at Cape Kennedy would be valuable. Later, he added that the NASA equipment, in many instances, is standard commercial equipment.

Mr. Carlson said that the NASA facilities were "a highly specialized group of data processing installations," but that he felt the antitrust case could be advanced by the trip. He also suggested that consideration be given to visiting a "more commercially oriented installation, perhaps in the New York area." There are several large, sophisticated commercially oriented computer instal-

Our Minisystem is eager
to go to work on your toughest
communications and control problems.

Honeywell has been using the Minisystem* approach for years to handle complex data networks — in manufacturing plants, hospitals, and airlines.

These systems are eager to handle communications and control problems — either independently or with larger computers in total information networks.

They can provide on-line, real-time access to both in-house communications systems and remote data facilities.

They work to keep production lines and equipment operating more productively.

And they can cut telephone costs by concentrating data.

One reason they can do all this

is they're backed by Honeywell's software, service, and support.

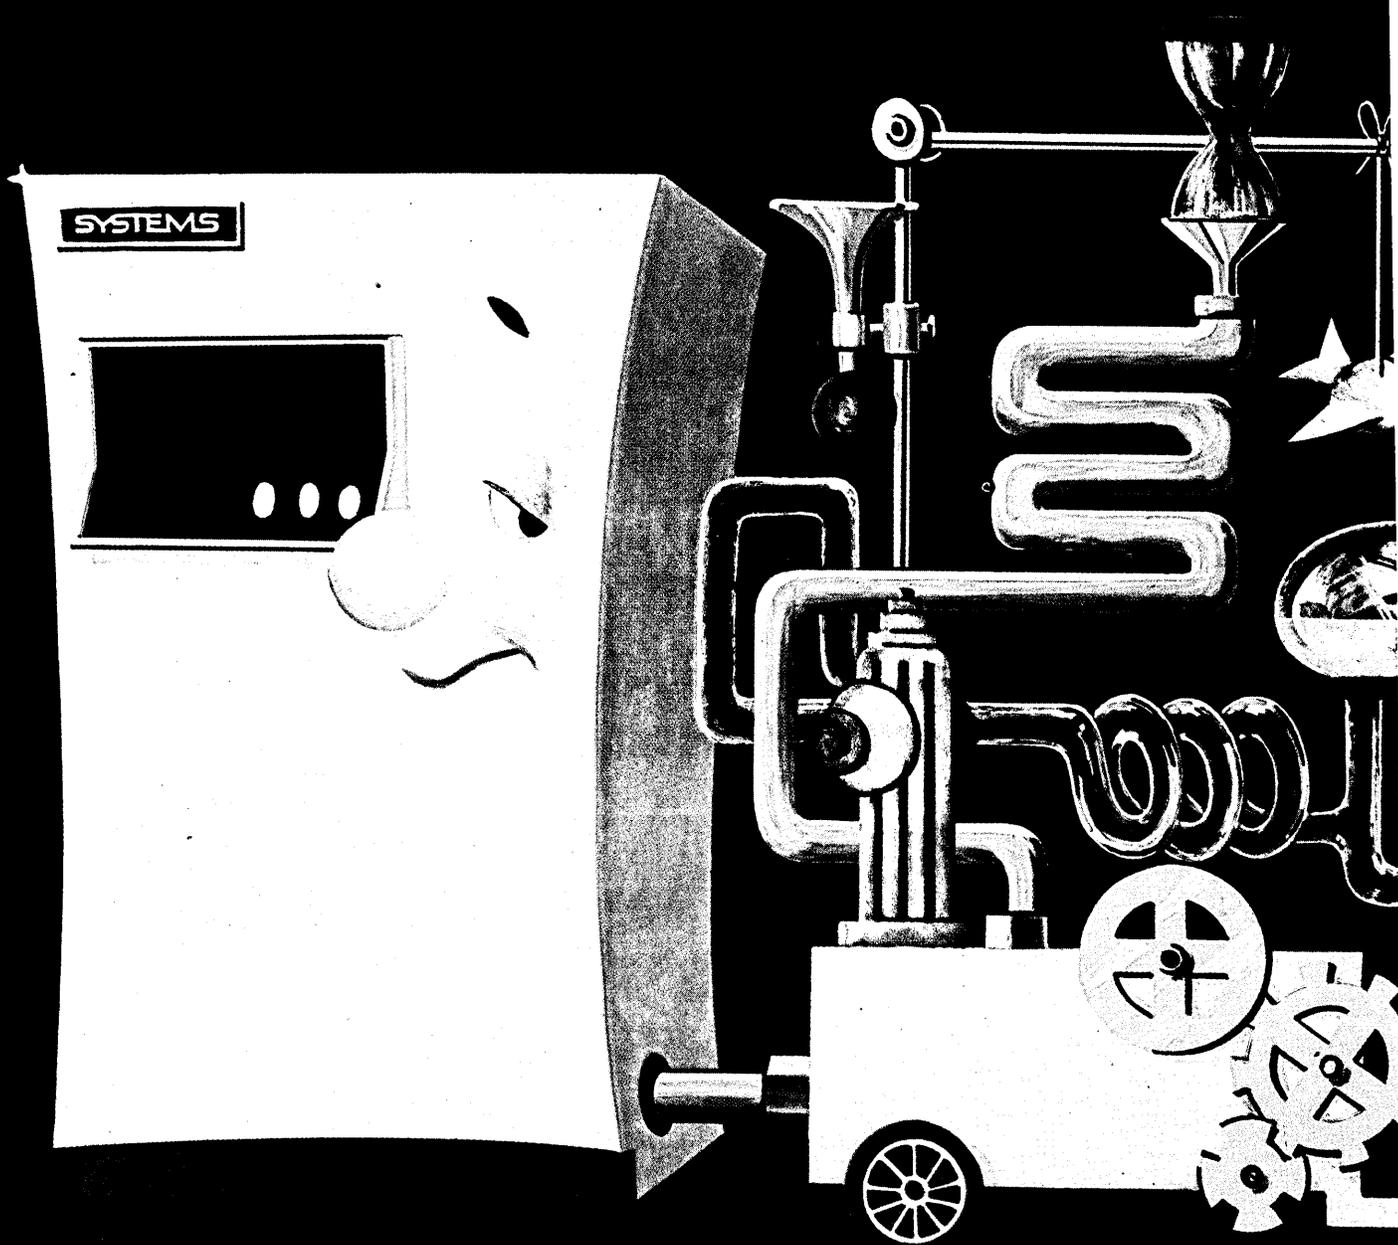

All it takes to put a Minisystem to work on your problems is a call to your local Honeywell representative. Or a letter to: Minisystem Marketing Manager/ Honeywell Information Systems/ MS061/ 200 Smith Street/ Waltham, Massachusetts 02154.

*Trademark, Honeywell Information Systems

Solutions come in a

shapes and sizes.

And contrary to opinion, computers, in and of themselves, are not solutions.

Solutions for application problems like yours require software, front-ends, peripherals, and a host of other gear, not the least of which is the computer.

Then to get your particular job done, there's bound to be some custom work needed. On hardware. And on software. You don't normally find solutions on the shelf.

Solutions are what we know and do best. That's because we are a *computer systems* company. A difference that could mean a lot to you.

At SYSTEMS Engineering Laboratories we design and build total systems. Total solutions for all sorts of tough application problems. And because we build our own, it's a competitive edge that separates SYSTEMS from all the others.

For openers, we design and build our own computers. Like the industry's fastest 32-bit processor, SYSTEMS 86. And the industry's lowest priced 32-bit machine, SYSTEMS 85. In the 16-bit range we have the first small computer with virtual memory, SYSTEMS 72. And its all-core memory companion, the SYSTEMS 71. In the same range we have the undisputed price/performance champ, the SYSTEMS 810B.

Alongside the widest selection of standard peripherals and front-end equipment available, we also create our own very special bells and whistles. Custom front-ends. Custom peripherals. Custom software. Whatever special touch you need to get that just-right system.

And, of course, we close the loop. With the installation expertise, the service, and the training. The whole package.

It's this custom capability, this willingness to engineer a new way, that makes SYSTEMS different.

And for you? It's really the only way to solve that application problem. With the solution sized and shaped just for you.

The SYSTEMS way.

To find out more about your solution (in the U.S. and Canada) call or write John W. Schneider, Vice President — Sales. (305) 587-2900. In Europe call or write James Baconnet, Director — International Operations, 85 bis, Avenue Albert 1er, 92, Rueil — Malmaison, France. Telephone 967-83-17.

lations within walking distance of the courthouse in Manhattan.

It is not precisely clear from the transcript why the trip was canceled. NASA refused clearance, noting that IBM had not given NASA ample notice, with the result that there was concern the NASA installations would be too crowded. In addition, NASA, being a part of the government and, as such, a part of the government case against IBM, did not approve of a party that would consist of the judge, the Justice Dept., and IBM.

Of ITT and planes

Moreover, the celebrated ITT antitrust controversy, triggered by the so-called Dita Beard incident, was in the news at the time, and government officials were sensitive to it. In discussing the government's refusal to grant clearance for the trip, Mr. Barr said: "I think I would be less than candid if I did not say to the court that in the day or so preceding this abrupt about-face, we began to hear from the government mention of the ITT affair; we began to hear from the government mention of the use of a plane from another corporation by a former head of the antitrust division; and all of a sudden, those matters seemed to have some relevance to what we were doing."

Judge Edelstein was sensitive that the trip not be construed as a junket or a party, and at one point he said: "I don't know why you insist upon referring to this as a party. I can't understand that characterization whatsoever . . . I consider it a scheduled hearing."

Judge Edelstein, maintaining that he thought the then acting attorney general Richard Kleindienst should have been advised of the importance of the trip, ordered Mr. Carlson to present the entire record of the trip and its cancellation before Mr. Kleindienst.

Kleindienst replied to the judge that "government counsel had serious reservations concerning the propriety of the use of an IBM aircraft for the purpose of transportation," but did not attempt to obstruct the trip. He noted that Justice Dept. officials attempted unsuccessfully to obtain a government aircraft for the trip.

Although Kleindienst alludes to an "IBM aircraft," it is not clear from the transcript whether or not the firm planned to use one of its aircraft for the trip. In the transcript, Judge Edelstein had stated that he had indicated "from the very outset . . . that I would not trav-

el in an IBM plane."

Meanwhile, the court order prohibiting participants in the case from talking with the press has been strongly protested by the Assn. of Data Processing Service Organizations (ADAPSO), which has petitioned the court to withdraw the order. ADAPSO refers to it as an "order of secrecy" in its petition.

It adds: "This is not a jury trial, and the only reasons which come to mind for the suppression of public information are those of military security, trade secrets, and the like. If these are the reasons for privacy, certainly, at least, the public should be told so. Unexplained secrecy inevitably generates suspicion that there is something to hide."

Assistant Attorney General Thomas E. Kauper, chief of the Justice Dept.'s antitrust division, wrote to ADAPSO saying the order was "never intended to be 'an order of secrecy,' as you call it." He added, in replying to a letter asking him to persuade the court to withdraw the order, that the order was "designed to assure that the public and the news media would have access to

Governments

Municipal Systems: Two Ways to Go

Pasadena, Calif., population 114,000 home of the Tournament of Roses, soon will have an on-line, interactive municipal information system which it claims will be the first operational municipal data processing system of its kind in the country.

The city last month publicly demonstrated three operational modules of its system and explained two others which currently are being tested and are scheduled to become operational before the end of the year.

Charlotte, N.C., population 242,000, also is working on a municipal information system and expects to have a good chunk of it up and running by the first quarter of 1973.

At first glance the two cities' approaches to systems development appear completely dissimilar. Pasadena doesn't own a computer. Charlotte owns two. Pasadena has funded its system development on its own. Charlotte has a grant from the Urban Information Sys-

all proceedings before the court and to all papers on file with the court in this case."

ADAPSO maintains that many documents and other papers crucial to the case are often not filed on the case docket or are filed so late as to make them useless to many who could otherwise make use of them.

The ADAPSO petition also makes another important charge regarding the case: "IBM's role is that of prosecutor, not defendant." Its argument is that the Justice Dept. has limited resources when stacked up against IBM's legal resources. It says the major part of the case's recent proceedings has been initiated by IBM and that the undermanned and underfinanced Justice Dept. staff on the case is unable "both to meet IBM litigation demands and still at the same time move forward with the government's own active preparation."

IBM and the Justice Dept. won't comment, citing the restrictive court order on the press. ADAPSO, however, said that the hearing on its petition would be conducted in New York on Sept. 12. It said also that additional papers were to be filed by IBM, the Justice Dept., and ADAPSO before the hearing.

—W. David Gardner

tems Inter-agency Committee (USAC) of the Dept. of Housing and Urban Development (HUD) and hopes to get one for a portion of its system from the Law Enforcement Assistance Administration (LEAA).

But the two systems are aimed at similar problems, and a closer look shows similarities in the two approaches. Both started by putting together teams which blended functional and data processing experience. Both are using a modular approach. Both are working with outside vendors whose on-site employees are so integrated with city employees assigned to development staffs, an outsider couldn't tell one from the other.

Pasadena city manager John Phillips decided in 1967 that the city needed some kind of management information system. A consulting firm was brought in to conduct a two-year joint study with city personnel and to recommend a plan for an MIS. This plan was approved by the city council in April 1969.

"We made, at the outset, a number of decisions," said Pasadena's mayor, Donald F. Yokaitis. "We knew we wanted a user-oriented, real-time system;

(Continued on page 121)

A Fullspace filing system eliminates permanent aisles to increase storage capacity up to 100% more than conventional shelving or file cabinets.

Fullspace storage units close together with just one aisle. With little effort, wood shelving units glide on sealed roller bearings to create an aisle where you need it.

Versatile and durable Fullspace movable storage units are designed to hold materials and records singly or in containers of all sizes and shapes. Each shelf easily holds a 500 pound distributed load. Shelf height is adjustable in one inch increments for full use of vertical space, too.

Fullspace is the single, most practical storage system for over 10,000 companies that specified this modern movable storage system. Some typical Fullspace users include hospitals, financial institutions, data processing service centers, clinics, schools, libraries, legal offices, parts storage centers, printers, utilities, insurance companies, government agencies and offices, publishing houses, retailers, manufacturers and general offices.

What is your need? To reduce your storage space? Or to store more in the space you have? Fullspace helps you either way.

Write today for full details, including free planning, layout and estimating.

**Our terminal capabilities outnumber
your problems.**

The answer to your remote-computing terminal needs is probably right on this page.

For instance, most of our teleprinter models offer great interface flexibility. So they can talk to computers and other business machines. You also have a selection of ASR, KSR and RO terminals. So when you pick the line that matches your budget, you get a terminal that matches your needs. And they all deliver the reliability and economy that Teletype Corporation has built its reputation on.

Start with our model 33. Reliability and economy make it the most popular terminal of its kind.

For more features in an economical line, take a look at our new model 38. It prints 132

characters per line on standard computer print-out stock. And it generates all 128 ASCII characters.

Our rugged model 35 is designed for heavy-duty, round-the-clock operation—year in and year out. It moves data at 100 wpm and offers a broad range of features.

Our model 37 offers the utmost in vocabulary and flexibility at up to 150 wpm. In addition to the ASCII characters, you can add up to 32 special characters of your own.

To move information at speeds up to 2400 wpm, simply team any of the above keyboard terminals with the Teletype® 4210 magnetic tape data terminal. It will record data, then speed it along on-line either manually or unattended.

What else? Three different interface options: a built-in, factory-tested modem; a current interface; or an EIA interface. Plus paper tape senders and receivers with capabilities of up to 2400 wpm.

It takes more than manufacturing facilities to build the machines Teletype Corporation offers. It also takes commitment. From people who think service is as important as sales. In terminals for computers and point-to-point communications.

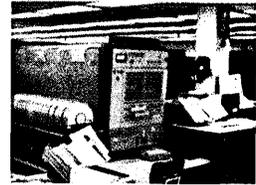

That's why we invented a new name for who we are and what we make. The Computer-cations people.

news in perspective

one which would place terminals at easy access to those who would need them; a system which would provide immediate response with up-to-the-minute information. We knew we needed a system which, like the city itself, would be composed of various subsystems, each receiving and generating its own functional information, but also contributing to other subsystems and to the whole — information for general management decision making."

Mixed backgrounds

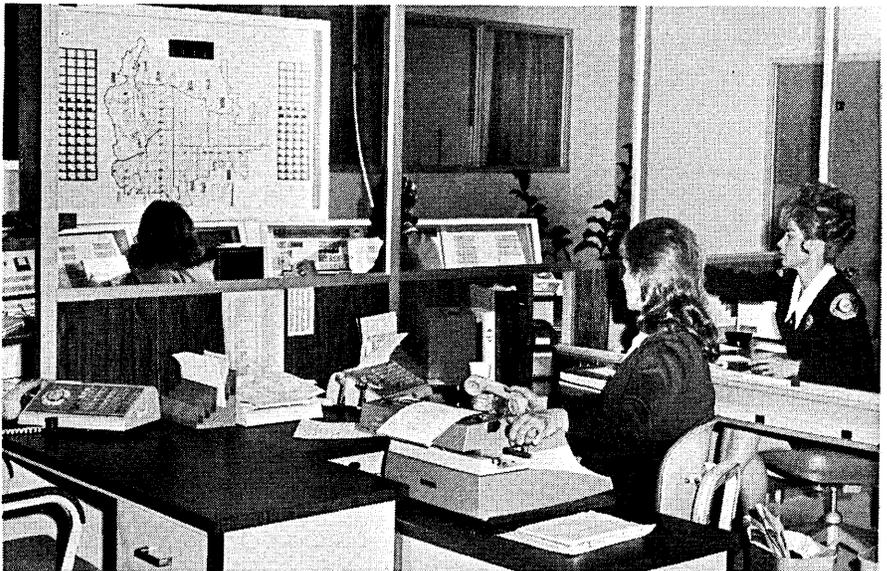

In July 1969, Pasadena began putting together a systems division "whose job would be not to run computers or do programming, but to manage and guide the development of the Pasadena Management Information System (PMIS) and to serve as an interface between the system and city government at all levels. Today this division has 11 people with mixed backgrounds: two data processing, one psychologist, one insurance, one accounting, and so on, to

tems programming group in nearby Marina del Rey, Calif., where the Xerox Sigma 7 computer, on which the system is running, is housed. When this group has completed development of a module, it is returned to the city for testing and training. Then comes debugging and implementation.

For XCS, which is absorbing most of the development costs (projected at just under \$400,000 for the coming year), the arrangement affords saleable products. James Campbell, president, said XCS already has 14 cities in the Los Angeles basin using products the firm developed with the city of Pasadena.

"Training City"

There's also the experience gained in developing and implementing a total municipal information system which XCS hopes it can use with other cities both larger and smaller. In fact, it says, a lot of cities have been watching closely the developments in Pasadena, and

POLICE Information Reporting System is one of first modules of Pasadena's on-line interactive municipal information system.

encompass all the major functions with which PMIS will have to deal.

In January 1970, the city of Pasadena entered into a joint venture relationship with Xerox Computer Services, and full-scale development of PMIS was under way. XCS has two on-site employees who work with the city's Systems Div. full time and numerous others who are "in and out from time to time." When a module has been designed and specified by the Systems Div. and approved by city user departments, it is turned over to an XCS sys-

representatives of at least one, San Bernardino, Calif., were on hand for Pasadena's public demonstration. "Pasadena has been ideal as a training city," said Bill Cavanaugh, project director for XCS, "because it has all the exceptions. Any other city would have to be easier."

The annual Tournament of Roses parade is one of these exceptions. For a short time each year demands on a number of city departments like sanitation, traffic, and fire change drastically. "We have to completely redistrict the

fire department," says Frank Lagatutta, a city employee on the systems staff, "to assure that no truck would have to cross the parade route to get to a fire." The system takes care of this as it does a special budget problem created by the annual extravaganza. "Most of the extra expenses incurred by various departments involved with the parade, its preparations, and its aftermath, don't come from department budgets, but from a special budget which is provided for in the integrated financial system module of the MIS."

In addition to the integrated financial module, modules currently operative in Pasadena are the Municipal Services Billing System and the Police Information Reporting System. Coming soon are the Community Manpower Planning System and the Health Services System. The system is costing the city \$16-17,000 a month as it is now operating. By 1978 Pasadena expects to have achieved all goals set when it started planning the system. "And by 1991," says Mayor Yokaitis, we will have recovered everything we put into it, assuming we stand still, but we won't."

The Charlotte system is somewhat more expensive. Design and development in fiscal year 1973 (begun July 1) are projected at \$1,630,000; but \$1,130,000 is reimbursable under the city's USAC contract. Additional equipment costs in the year will run \$312,000; however, \$200,000 of this will be offset by LEAA funds.

Even a policeman

System development started in Charlotte in Feb. 1970. Completion is scheduled for fiscal year 1975. The vendor working on this system is System Development Corp. The city had had some data processing before the project got under way; and when it did, an existing data processing department was transferred into a new MIS department of which it became half. The other half is devoted to the project and is staffed by about 40 people, 21 from SDC and the rest from the city. Assignment to specific tasks within the project "is made on the basis of talent and know-how" said Don Luria, SDC project manager, and without regard to employer. All have data processing ex-

perience and some also have functional experience, "including a guy who used to walk a beat as a policeman."

Charlotte currently has three modules of its MIS operational. These are a utilities module, a police wants-and-warrants module, and a landfill control module which is concerned with solid waste disposal. The last is a batch operation, while the others are on-line and interactive.

In design and development stages and due to be operational in the first quarter of 1973 or shortly thereafter are inventory/purchasing; information complaints and requests for service (for responding to citizens on everything from complaints about potholes to reports of signs knocked down); a geographic data index which will not be of direct service to citizens but rather will support other modules; fire operations, which will allow dispatchers with terminals and radios to obtain information on characteristics of the neighborhood, the affected buildings, and the people in them and relay it to firemen in trucks on their way to fires; equipment management, serving all departments with mobile equipment; redevelopment/relocation, assisting people who must relocate as a result of city projects; building

permits and code enforcement, concerned with automating the permit application process and the code enforcement process; personnel operations and personnel management; cost accounting; and vital statistics.

The system runs on a 128K Univac 70/45 and a 512K Univac 2. "The fact that we had RCA equipment back in September of 1971 did create some problems," said Luria. "We had decided upon IPS 70, a transaction process and data management system which pleased us because it meets almost the exact functional requirements of a system which has to meet the needs of heterogeneous users with overlapping data requirements. We believe we were the first or second customer to decide on it."

"There was a hiatus for six months after RCA went out of the computer business," said Dr. Launor Carter, vice president and general manager of SDC's Public Systems Div. Resources were diverted from modules which were almost operational back to design of others. "Two months ago," he said, "Univac assured support for IPS 70, and now we can go ahead and make some more programs operational." Luria said IPS is up and running seven

days a week, 24 hours a day, and support has been satisfactory. "But the delay had its psychological effect."

Work in stages

Charlotte's project staff, like the XCS-Pasadena team, works in stages. As resources for a given module become available, Luria explained, it is turned over to a design leader who is assigned two or three people to design it and specify it, working closely with user departments. There usually are from four to seven modules in design at any given time. When the design team is finished, and again as resources become available, the module is turned over to a development leader and a team of three or four; and they write programs, develop the module, and test it against parameters set up by the design team. Next, in the same way, the module is handled by implementation and training teams which work closely together.

Luria said the completed municipal information system will be transferable to other cities larger and smaller and with different kinds of city government. "That's the aim of the USAC program."

To facilitate transferability, he said, the project staff is producing detailed

documentation as it goes along, including technical documents which describe parts of the system and management modules "which are almost instructional on how we do everything we do" and which will include one on how to manage a project of this size and scope.

Privacy

Who Will Control the Data Banks?

Comprehensive regulation of government-supported data banks to prevent invasion of individuals' privacy is the ultimate goal of a bill Senator Sam Ervin (N.C.) plans to introduce shortly. Ervin, generally considered the most knowledgeable constitutional lawyer in Congress, recently became chairman of the Senate Government Operations Committee; the bill will be referred to this group, so there is little doubt that it will be reported to the Floor.

The Ervin bill will join a number of others addressing the computer-gener-

IN THE COM FIELD,

Let's face it. Choosing the right COM company is no cakewalk.

Not with more than a dozen companies, including the rich and famous, competing for your attention.

Herewith, a few simple facts to clear the air:

1. Of all the companies now building COM (Computer Output Microfilm), only one company builds a complete range of hardware for every need: recorders, film processors, duplicators, viewers, viewer-printers, fiche cutters and shredders.

2. Only one company delivers parts and service for COM everywhere in the world.

3. Only one company sells every replenishable supply used in COM.

4. Only one company will lease you COM, with fiche and roll capability, for as little as \$750 a month, based on what you use.

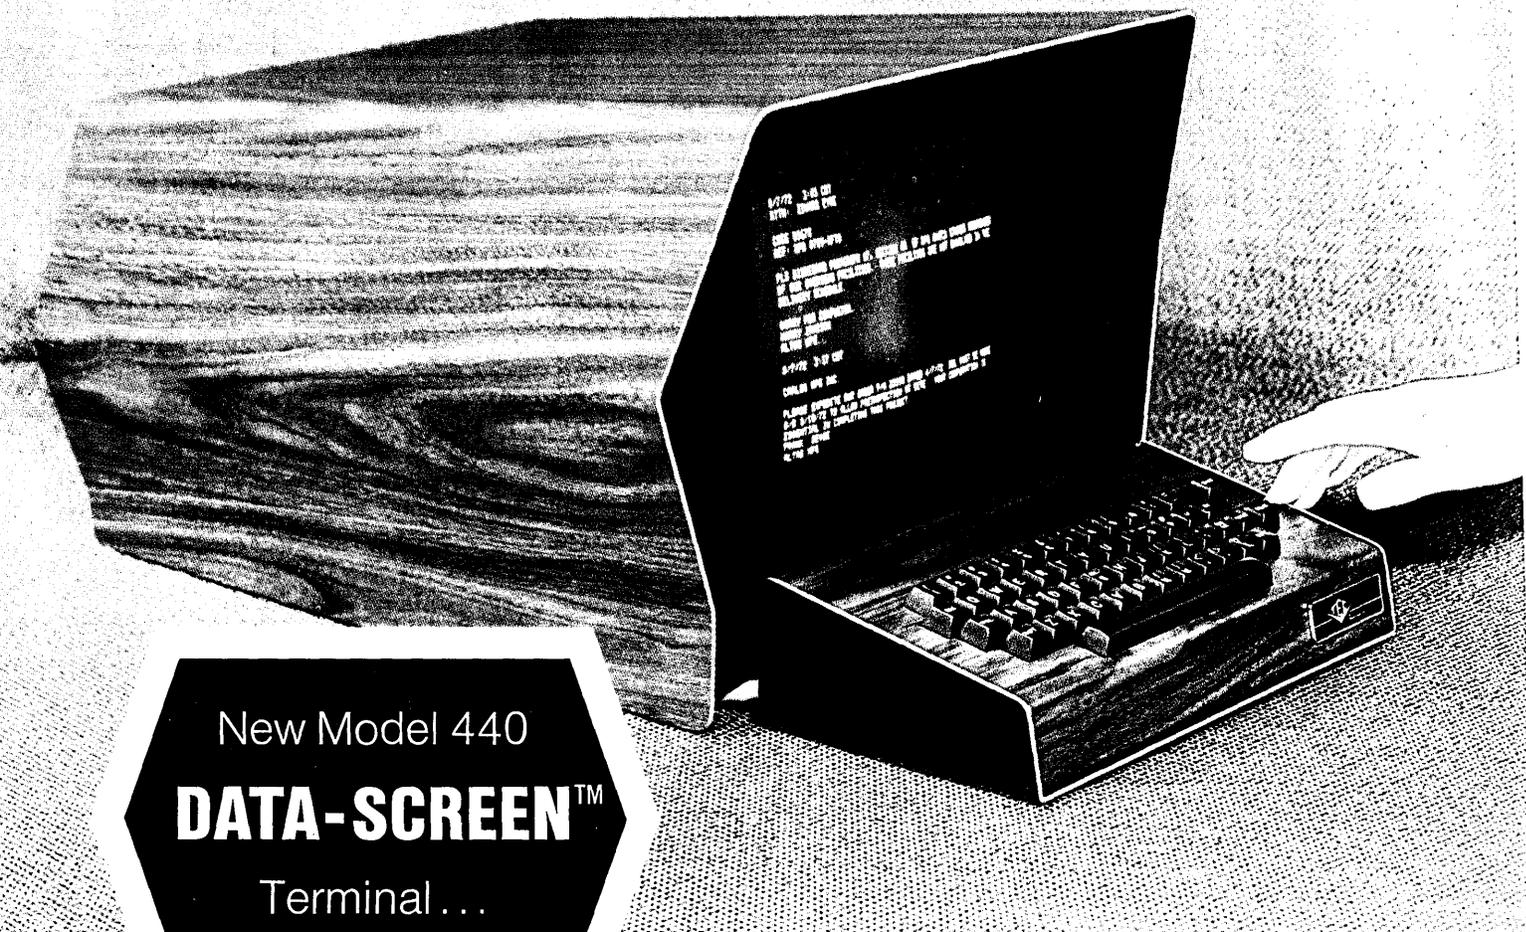

Our company, DatagraphiX. We invented COM in the first place.

Because it's still our only business, we give COM everything we've got. Which may explain why we've installed more systems than our three nearest competitors combined.

Call us: (714) 283-1038. Or write: DatagraphiX, Box 2449, San Diego, Calif. 92112.

DatagraphiX

We're to COM what Kodak is to cameras.

ated privacy problem which already have been introduced. Because of all this legislation, there probably will be a lengthy debate on the whole subject in Congress next year. The other bills are concerned with banning military surveillance; protecting the privacy of arrest, employment, and bank records, as well as passport information. A hot battle was raging in the Senate at press time regarding the dissemination of arrest records on individuals who are subsequently not convicted. A rider attached to the Justice Dept.'s FY'73 appropriation bill would prevent dissemination of such data to banks or state/local government officials. Among the pending bills is one backed by the Administration that would allow the Attorney General to disseminate the data to these sources if he thought it was desirable.

Introduction of Ervin's bill will follow the recent release of an analysis by the staff of the Senate Subcommittee on Constitutional Rights of lengthy hearings it conducted last year into Army surveillance of civilian political activity. In the preface to this analysis, Sen. Ervin—who is chairman of the subcommittee—comments that the files col-

lected on protesters and protest groups "posed a clear and present danger to the privacy and freedom of thousands of Americans—citizens whose only 'offense' was to . . . exercise rights they thought the Constitution guaranteed to them. These files confirm . . . that Army intelligence, in the name of preparedness and security, had developed a massive system for monitoring virtually all political protest in the United States."

By its own admission, the Army didn't gain any useful information from this massive data collection effort. The report includes the following quote from the Army's general counsel: "They (the surveillance records) were the most worthless damn things I had ever seen in my life. It was a waste of paper."

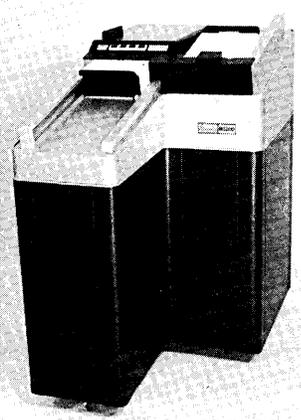

Destroyed or "classified"?

Many of the files were destroyed, according to the Dept. of Defense, but the subcommittee staff suggests in its analysis that many dossiers are still being preserved in various military intelligence agencies. Some were "classified" shortly after the investigation began. And "lack of time and resources

prevented us from making the same inquiries of the Navy and Air Force (that were made of) the Army."

Stamping a top security classification on documents requested by the subcommittee was one of several gambits the Army used to frustrate the investigation, says the report. The Defense Dept. declined to let certain intelligence officers testify. Some agents "were threatened with prosecution if they talked." As a result, "military intelligence has become more of a closed society than at any time in its history." In some cases, according to the analysis, the subcommittee "appears to have been lied to; in other instances it appears to have been victim of the art of 'plausible denial' . . . by which intelligence agencies (and others) admit just enough of the truth to mask an essential falsehood."

One instance of "plausible denial" cited in the report involves the Army's assistant chief of staff for intelligence; his office denied that computerized files on nonviolent political protesters and protest groups were being kept at specified locations. Later, after the existence of these files was disclosed in the press, Army officials "discovered" the files. Still later, according to the subcommittee report, it was found that

news in perspective

printouts from the files were being transmitted to the assistant chief of staff for intelligence as early as 1968, long before his office "discovered" that the information existed. The final example of hypocrisy was that the original denials, and the subsequent discoveries, were made by personnel who worked in a room which housed one of the files.

The subcommittee staff estimated, on the basis of admittedly fragmentary data, that Army intelligence had "reasonably current files on the political activities of at least 100,000 individuals unaffiliated with the armed forces." In addition, Army intelligence agencies had, and have, access to outside files of the FBI and other military agencies, including the Defense Central Index of Investigations. Reportedly, the latter data contains 25 million index cards relating to individuals and 760,000 cards relating to organizations and incidents.

Immunized from review

The beginnings of the Army's civilian surveillance program go back at least to the end of World War II, the subcom-

mittee reported. Lack of both military and civilian control enabled each major data bank to develop independently, "in a milieu which showed little concern for . . . privacy, freedom, efficiency, or economy." Meanwhile, "the traditional secrecy we have granted our intelligence agencies immunized each echelon from review by its superiors."

Ervin's new bill was still in rough form at press time, so details may change, but essentially it addresses the privacy threat posed by all information collection, processing, and distribution activities supported by federal military and civilian agencies. A commission is authorized by the legislation—consisting of three Senators, three Representatives, and three other members selected by the President from outside the Executive Branch. It would recommend "legislation . . . and other action" aimed at:

Restricting the information collection effort made "by or for government agencies" to items "relevant and necessary to the statutory responsibilities of these agencies";

Standardizing the handling of this information, from collection to dissemina-

tion and use, so that constitutional rights of citizens and states are not jeopardized;

Limiting authorized access to individual-sensitive government information. One set of committee recommendations would be designed to make such information available only to those "who have a valid interest, as defined by statutes." Another set of recommendations would aim at preventing unauthorized access.

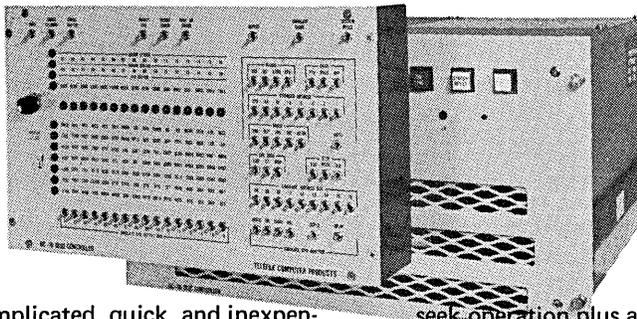

The commission is also given extremely broad authority to evaluate ex-

Companies

Informatics, Data Products: 10 Years

Few things are nicer than a birthday party. Unless it's two birthday parties for two jointly launched edp companies who successfully weathered the stormy decade just passed.

In 1962, Erwin Tomash, then vice president and general manager of Ampex Corp.'s Computer Products Div., and Dr. Walter Bauer, head of Ramo-Woolridge's computer installation, de-

Marrying Non-IBM Computers To IBM Compatible Disc Drives Can Be Like A Las Vegas Wedding...

Uncomplicated, quick, and inexpensive—when a Telefile disc controller ties the knot. Here's only a few of the reasons why:

Telefile controllers handle up to 8 disc drives for almost any non-IBM computer. Our DC-16 helps out most 16 bit minis, while our DC-18, DC-32 DC-36, and DC-10 bring IBM compatible drives together with PDP-15's, Sigma 5's and 7's, Univac 418's and PDP-10's respectively.

Telefile controllers make for uncomplicated marriages too. They're easy to program, with only 8 commands required (10 for the DC-32). Read or write multiple records is done with a single command. And there's simultaneous

seek operation plus automatic hardware performance of many disc controller functions normally performed by software.

Your computer will never have to wait to get the last word in (or out) of the disc with our extremely fast response time, since unlike most other controllers we do not require a sectored pack. In addition, there's IC buffering plus a host of hardware character redundancy and verification checks.

It'll be a quick marriage too, because we deliver from production, usually in less than 60 days.

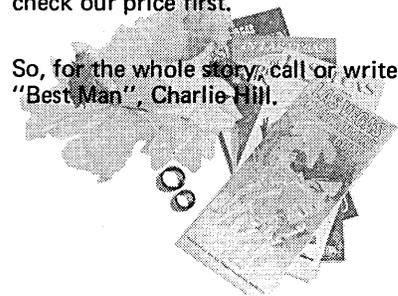

Telefile is price competitive with anything on the market. And if you're looking for a package deal including the drives, you'll be sorry if you don't check our price first.

So, for the whole story, call or write our "Best Man", Charlie Hill.

isting privacy safeguards affecting not only federal, state, and local government information systems, but related private systems as well. In addition, if the bill is enacted, the commission will be able to subpoena witnesses and records. If the latter are withheld, the commission will be able to seek court orders directly. Among the materials that will be obtainable by court order are computer program documentation and system analyses pertaining to the data banks covered by other provisions of the bill.

—Phil Hirsch

cided separately to launch, respectively, a hardware company and a software firm. "It was a bad time," said Dr. Bauer. "The market was soft, and venture capital was hard to come by." So the two men got together. Tomash's company, Data Products Corp., managed to secure \$1 million in venture capital from three different sources, and it and Bauer's Informatics were launched jointly, with Informatics starting life as a wholly owned subsidiary of Data Products.

According to plan, Data Products, which is in the peripherals and data communications business, divested it-

self of its ownership of Informatics in three pieces in 1965, '66, and '69. And last month the two separately observed their tenth anniversaries with healthy statements of operations and optimistic outlooks for the future.

For Data Products it was a turnaround situation, with the company reporting income of \$703,000 for fiscal 1972 after a loss of \$10,573,000 in '71. Theirs was the more cautious optimism and the quieter of the two tenth-anniversary observations. Said chairman Tomash and company president Graham Tyson: "The near-term outlook for Data Products for the next fiscal year is promising. While weakness is still being exhibited in many sectors of the electronic data processing business, the across-the-board slowdown of the past two years seems to have disappeared. The steady profit improvement begun last year should continue into the current year."

In answer to a shareholder question, Tomash admitted that Data Products foresees inroads being made into its core memory products market by semiconductors but added: "We've reduced the costs of core and improved performance. We feel we've extended the life of core for many years, but we in-

tend to limit our investment in this area and not to grow in it up to the last year."

Hit the exports

Tomash said an immediate aim of Data Products is "to hit the export market hard." The company is increasing its marketing staff in Eastern Europe and "has received at least one multimillion dollar printer contract which is awaiting approval from the U.S. government." Data Products has shipped evaluation printers into Poland, Romania, Bulgaria, and Hungary. "Interest in our core memory products is also high in Eastern Europe," said Tomash.

Informatics' anniversary shareholders' meeting was a bit more positively optimistic and definitely more festive, perhaps because it included champagne and birthday cake and predictions by executive vice-president Frank Wagner, who likes to make predictions.

Dr. Bauer summed up the future like this: "In view of the improving market for the company's services and the excellent position of the company in the software field, we expect continued growth in revenues and profits and further strengthening of the company's

JASON DATA SERVICES
903 EAST NORTH STREET
MANTECA, CA. 95336

Rest easy, we're not talking needless extinction, but our company grew out of a simple idea.

Eliminate the pokey old punchcard. Go directly to magnetic media. You'll increase throughput 15% or more, and the bundle you save will be in both people and equipment costs.

Good ideas have a habit of growing. And the newest in a full spectrum of MDS key-to-tape capabilities is System 2400 key display.

The tutorial CRT not only tells inexperienced operators what to do, it lets them see they're doing their

work right. What's in it for you is quicker, cleaner data entry.

But data entry only scratches the surface on System 2400. This one can be a dedicated cluster of up to 20 positions, sure. It can also be a communications terminal. What's more, it can off-load the mainframe for editing and sorting and printing.

And now, with the

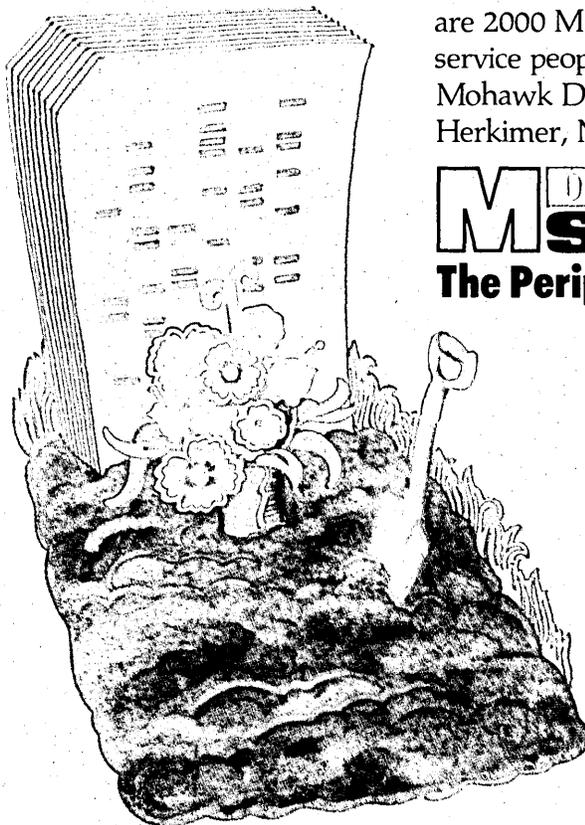

boost in available core to 65k, System 2400 can be all of the above. You can configure yourself out of a lot of problems and into some real savings all at the same time.

Questions? Good.

You call, we'll come. Call our nearest office or call MDS Domestic Marketing Dept. 22 at (315) 867-6610. We'll send the MDS man near you. And that's easy, because there are 2000 MDS sales and service people in the field. Mohawk Data Sciences Corp., Herkimer, N.Y. 13350.

the price/performance leader
in general purpose computers**

Model 980A

\$3,475

Quantities 1 to 100
with hardware multiply and divide
and many other built-in standard features

TI continues its leadership in price and performance with the new Model 980A general purpose computer.

The 980A, as with the 960A, is a fast, powerful and flexible 16-bit computer at a low unit price with all the features, built-in and *standard*. Consider these many standard features, compare the price and you'll see why the 980A is the most cost-effective general purpose computer available today.

- Hardware, multiply/divide with 16 or 32-bit add and subtract
- 750-nsec add immediate
- 5.25- μ sec multiply
- 750-nsec, full-memory cycle time
- Bit/byte/word/byte string data addressing
- Memory parity
- Programmable memory protect and privileged instructions
- Power fail/auto restart
- Power supply to support 65K memory
- Memory biasing (dynamic relocatability)
- I/O bus with 4 ports basic (expandable to 14 in basic chassis, 256 overall)

CPU with 4K memory	\$ 3,475
CPU with 8K memory	\$ 4,975
CPU with 16K memory	\$ 7,975
CPU with 32K memory	\$13,975

(prices are FOB Houston and do not include illustrated tabletop cabinet)

- Main chassis semiconductor memory expandable to 32K. (Up to 65K with memory expansion unit: Two weeks memory protect with optional battery)
- Full, lockable front panel with break point and 4 sense switches
- Switch-initiated ROM bootstrap loader
- Auxiliary processor port
- Direct memory access channel (expandable to 8 ports)
- Four priority interrupts standard (expandable to 64)
- 98 basic instructions (16, 32 or 48 bit)
- 9 addressing modes
- 8 working registers plus status register

A pre-generated standard software system is supplied which allows the user to generate custom system software. Additional soft-

ware for the 980A includes:

- Symbolic assemblers and cross-assemblers for IBM 360/370
- FORTRAN IV
- Link and source editors (object and source)
- Modular executive control routine including disc management
- TI Language Translator (TILT) to extend FORTRAN, assembly, or create special application languages
- Service maintenance, debugging and utility programs.

For applications support, TI offers the resources of its experienced Applications Engineering group. Also, training courses on 980A software and hardware are scheduled regularly, and TI service facilities are located throughout the United States and abroad.

Dear Ma: This cartoon reminded me of our data network-until Vadic.

Ma Bell
195 Broadway
New York, NY 10007

Dear Ma:

This cartoon reminded me of our data communications network. That is, until Vadic came along with their planned family of second generation 300 and 1200 baud modems and automatic dialers.

At our computer site, we installed Vadic's MDS system (center) where up to 16 Bell 103 & 202 compatible modems and 801 type auto calling units can be freely intermixed in just 7-inches of rack space. In remote locations, we use either Vadic's 4-channel box (left) which houses up to 4 modems (or a modem & a dialer), or Vadic's 1 & 2 channel stand-alone units (right).

Sure, the modems work great. But it's Vadic's systems understanding, their applications backup, and the built-in displays and diagnostics, that make it so simple to monitor & troubleshoot both ends of our data network.

Our operators can loopback data to check out the terminal, the modem, & the phone line, and can watch computer and terminal activity through display of all EIA leads—at both ends! Vadic's powerful diagnostics, plus built-in 300/1200 baud test signals, make it easy to completely test any channel. No wonder our system uptime is so much greater these days!

Better send for Vadic's new brochure, Ma. It's "must" reading for data comm people. See you soon.

P.S. Who's Vadic?
They've delivered
over 15,000 modems
in the past 3 years.

Your son, the independent
thinking communications manager

Alexander Graham Jr.

vadic

THE VADIC CORPORATION • 505 E. MIDDLEFIELD RD. • MOUNTAIN VIEW, CA 94040 • (415) 965-1620

position." He said he believes Informatics has "the best balance sheet relative to size." A big thing for the future will be acquisition and mergers.

There are some 500 installations around the world now of the company's Mark IV file management system, Dr. Bauer said, and some 10,000 people

HAPPY BIRTHDAY: Erwin Tomash, left, and Walter Bauer.

are qualified to use Mark IV, of whom Informatics trained 7,000. Informatics, which, except for its first six months, has regularly shown a profit, reported earnings of \$424,000 for fiscal 1972, up from \$268,000.

Wagner, who said Informatics currently has 0.2% of the software market, predicted it will have 0.6% in 1975. Most of his predictions were predicated on IBM's becoming a government-regulated company, much like AT&T. This, he predicted, will occur in 1977 or 1978.

For the hardware sector of the industry, he said, survival will depend upon U.S. regulation of IBM. He sees hardware companies surviving until regulation and growing slowly afterwards. He feels independent peripheral manufacturers and leasing companies will have a difficult time before regulation but have a bright future after.

Wagner's evaluation of the future for the software industry was — not much affected by IBM, slow growth for custom software, and rapid growth for software products. For data processing services he predicted: decline of the service bureau; slow growth for time-sharing, rapid growth of computer utilities; and a bright future for data base services.

Among his major conclusions were that the trend toward mainstream-type edp operations will be up and that edp eventually will become the largest U.S. industry.

And it looks as if both Data Products and Informatics will be a permanent part of it.

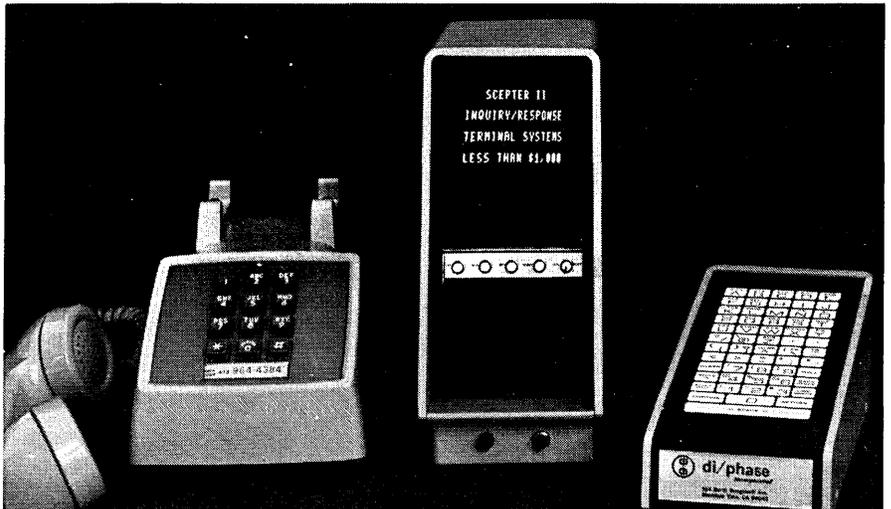

—E. M.

Terminals

A Tiny Terminal for Quick Peeks

Some applications really need to be on-line. People at numerous remote locations may need to access a data base, perhaps updating a file or taking a quick peek. And the length of the message, whether going into or coming out of a file, is short. For such usage, a new crt/key-board system has been developed by one-year-old Di/Phase Inc., Mountain View, Calif.

It uses a 3-inch crt capable of displaying four 16-character lines, or 64 alphanumeric characters. There's also a newly developed 128-character keyboard with a full Mod 37 Teletype keyboard. Instead of mechanical keys, it

THREE-INCH CRT can display four 16-character lines and uses a 64-character keyboard.

uses a pliable elastomeric membrane imprinted with the key designation. The free-standing system, which operates in a half-duplex mode, is designed to sell in small quantities for \$1000 and rent for about \$30 a month.

"A small, interactive terminal is especially useful in customer service appli-

cations," says Leo E. Feltz, president of Di/Phase. "In banks, there's a need to know a depositor's account balance. Retailers must look up a customer's credit record. In many businesses, one wishes to update or get the status of information on manufacturing, distribution, inventory, or purchasing."

Feltz, who formerly was director of product management and planning at Singer Business Machines, notes a hierarchy of computers (ranging from minis to large-scale), of calculators (handheld to programmable), and now of terminals ("There's a place for large crt systems, as well as small"). It's an unbuffered terminal, explains Peter R. Pettler, Di/Phase vp. When you press a key and an image appears on the tube, that character has gone to the computer and come back — at speeds up to 300 baud. So, what you see is what the computer got. They call it echoplexing.

Several units of the terminal are undergoing field test at a customer site,

according to Feltz, who says the plan there is to add new applications with the passage of time. Two other test sites, in different lines of business, are to take delivery before the end of the year. There's no longer any doubt that the under-\$1000 crt terminal is upon us.

CIRCLE 197 ON READER CARD

Conferences

WESCON Shedding Technical Image

The West's biggest electronics conference and trade show, the Western Electronic Show and Convention

(WESCON), is trying hard this year to deemphasize its strong technical image and to increase its identification with information processing industries.

No longer does WESCON have a technical program. This year it's a "professional program," one which includes 11 (out of 28) sessions and 47 papers and/or panel discussions on

topics relating to data processing and data communications. An increased number of edp industry names show up this year on the roster of session organizers and on the professional program committee, which is co-chaired by Eldred Nelson of TRW Systems Group and includes Guy Dobbs of Xerox Computer Services and Clark Weissman of System Development Corp.

With its technical image this year, WESCON has shed its traditional three-week-in-August scheduling and will be held instead Sept. 19-22 in Los Angeles' new Convention Center. It will be the first time in many years that the big show will be under one roof in its biennial Los Angeles appearance.

WESCON registration, which was

partly automated last year in San Francisco, will be fully computerized for the 1972 show. The system, designed and developed by Jacquard Systems of Santa Monica, Calif., includes five on-site registration modules consisting of two crt's and one high-speed inquiry badge embosser each. As it generates the badges, it will store pertinent visitor information on magnetic tape for later use in attendance auditing, post show billing, and generation of research information. The system also will include two remote registration stations, one in Orange County and one at Los Angeles International Airport, which will transmit all information to the Convention Center so that badges will be ready for bus commuters when they arrive.

rail passengers, and the nationwide system should be fully operational by late 1974. Control Data Corp. will supply the computers and peripherals; CDC's Ticketron subsidiary, the ticket issuing equipment; Cytrol, Inc., of Minneapolis will program the system; and communications from four regional reservations centers to dual CDC 3500s will be handled by the Bell System. Passengers will reserve seats and services by calling a single 24-hour toll-free phone number. The system is said to be more complicated than airlines reservations systems because trains make many more stops per trip than do planes.

System Success Story: The Migrant Student Record Transfer System (see Sept. 1, 1970, p. 64), which keeps school records on some 300,000 migrant students in the U.S., was used successfully this summer to find a 10-year-old girl whose school examination showed that she had tuberculosis. By the time the diagnosis was made, the girl and her family had moved from California. It took just a little over four hours to telegraph the CDC 3300 central computer in Arkansas and find that the girl was at a labor camp near Salt Lake City. "The system has always had the capability for emergencies," said program coordinator Patrick Hogan, "but this is the first time we've used it."

Fax First: In what is said to be the largest commercial facsimile transmission order ever signed in the U.S., Graphic Sciences, Inc., Danbury, Conn., will sell 1,000 of its dex I transceivers to Medfax Communications Inc., of Harrison, N.Y., which is setting up a facsimile communications system to service the health-related industry. The agreement includes an understanding for a follow-up order of another 1,000 units. The dex I, which transmits 8½ x 11-inch documents over voice-grade lines in 6 minutes, sells for \$2900 in single quantities.

European Sales Consortium: International Technology Sales Corp., a new London-based firm, has been started by Infotech founder Roy Goodman to help U.S. computer and related companies sell their products in Europe. ITS claims to represent over 150 companies in 23 countries who account for some 40% of Europe's sales. □

Benchmarks

The Last Fall Joint: From next year forward, the American Federation of Information Processing Societies (AFIPS) will sponsor only one major conference and exposition annually. It will be called the National Computer Conference. After independent research and upon the advice of an Industry Advisory Panel chaired by *Datamation* editor Bob Forest, the Joint Computer Conference Board made its announcement. The first NCC will be held the week of June 4, 1973, in New York City. The last JCC will be Dec. 5-7 in Anaheim, Calif.

Guns and Butter: In order to increase its investment in Data Transmission Co., a proposed nationwide all-digital microwave common carrier system (no revenues expected until '74), University Computing Co. has sold UCC Communication Systems, Inc., a terminal and communications subsystems manufacturer, to Harris-Intertype Corp. for approximately \$20 million in cash. A net capital loss of about \$15 million will be recorded in UCC's third quarter. Construction of Datran's first increment—linking Houston and Dallas—is scheduled to get under way before the end of the year. Earlier this year UCC had tried to sell its Gulf Insurance Co. subsidiary to Northwest Industries Inc. of

Chicago for approximately \$60 million, but the deal was called off as not "in the best interest of University Computing."

SCC Traded for Dormitory: Richard Kelly tried awfully hard to get into the computer business. It took him six months to acquire controlling interest in Scientific Control Corp., Dallas, from Penn Central affiliate, Great Southwest Corp. (April 1, 1971, p. 52). But now he has traded the company's computer operations for a dormitory complex near Southern Illinois Univ. In the year and a half that he has headed Scientific Control, Kelly has moved the firm into non-computer-related fields through acquisition. His decision to move it out of the computer business was made, he said, "because there's too much competition." The trade of Scientific Control's 4700 computer and 660 batch terminal products, patents, and operating divisions, with a book value of \$2.5 million, was to Consultronics, Inc., a Dallas-based electronics firm. And soon, Scientific Control will be no more. Its attorneys are researching potential nontechnical new names for the company to be presented for shareholder approval this month.

Reserving the Rails: Easterners will be the first to use the \$7 million Amtrak on-line reservation system for intercity

LEARN TO ANALYZE YOUR INVESTMENTS.

New audio cassette program offers you money-back satisfaction guarantee

New method with immediate benefits Now you can learn how investment opportunities are judged by professional financial advisers—how they examine and evaluate the possibilities of various industries. And you can start using this knowledge immediately to help you define your investment objectives and evaluate the advice you get.

Unique program of investment education You'll learn from the financial analysts themselves. In exclusive tape recordings. Education House has established a monthly series of these cassettes that will give you a comprehensive view of what is happening in industry categories that offer investment potential. Taking such industries as Pharmaceuticals, Insurance, Leisure Time, Airlines, Communications—the whole spectrum of American Industry—one by one, the analysts will give you an in-depth insight into how each industry functions, its priorities, growth patterns, long-range and short-range probabilities.

Authoritative information Every speaker in the Education House program is a thoroughly experienced investment adviser. For the most part they are senior Security Analysts at the nation's leading financial institutions, responsible for recommendations their firms make in the particular industry in which these men and women specialize. You'll hear three different financial analysts each month provide these thought-provoking, exclusive analyses—approximately one hour's listening time on each cassette.

Free cassette recorder/player You will receive a high-fidelity portable cassette recorder/player absolutely free when you become a subscriber to Education House. You can play your cassettes in your home or office, in your car, on a plane or train. A privacy earphone lets you listen without disturbing others.

Cost is low, value is high Education House has geared this program to bring you the greatest value possible in the self-education field. It's a current, up-with-the-news series of probing analyses that broaden your horizons in the whole investment field. Designed for your needs. Offering a "faculty" of professional analysts. A comprehensive, learn-by-listening program. A method completely adaptable to your time availability and interest span. A free cassette player that provides top-quality sound. All this is offered to you for only \$98.00 for a full year's program.

Starter series The current discussions being offered by Education House cover the fascinating fields of Pharmaceuticals, examined by Richard L. Schneider, CFA, Senior Vice President of Weis, Voisin & Co. Inc.; Leisure Time, analysed by Richard W. Steenken, CFA, Senior Analyst, Kidder, Peabody & Co.; and Insurance, explored by James B. Stradtner, Group Vice President, Legg, Mason & Co., Inc. You can start right away on your monthly investment education program with this series. Just fill out the order blank below and mail it today.

Education House doesn't expect you to become a professional analyst in your spare time. But we do feel sure you'll be able to evaluate investment advice on the basis of a much broader knowledge of each industry category. And we believe that will ultimately prove to be far more valuable than the nominal cost of our program.

FREE

CASSETTE RECORDER/PLAYER with microphone, privacy earphone, electric cord and batteries. Yours to keep when you are a subscriber.

educationhouse

P.O. Box 103, Cos Cob, Conn. 06807

Please enroll me in your monthly investment education program for one year. If not fully satisfied with the first program, I may return recorder/player and cassette within 10 days so that you may cancel my charter membership and refund my \$98. As a charter member, I will receive all monthly programs prepaid. There are no mailing, handling or other extra charges. \$98 is all inclusive. I enclose \$98.00 in check or money order.

The computer professional. He knows how perishable knowledge is, and the need to keep abreast of rapidly changing technology. The computer user. He knows the value of seeing what's new, and finding answers to his specific problems. The marketing manager. He knows the Fall Joint is this year's major national conference, and the prime environment for meeting his customers and prospects. The EDP press. Largest gathering in the field. They know how to get a peek at next year's news before it happens. The '72 FJCC has a lot going for the people who know everything, and want to keep it that way. If you're one of them, chances are you know where you're going in this business. Then you also know that your business will be going to Anaheim in December. To the '72 FJCC. Big, bold and different. Sixty-one information packed sessions and seminars, half of which are user oriented. This year's largest display of computer hardware, software and services. And all right in the heart of the growing West Coast EDP market. The men who know everything will be at the '72 FJCC. Give yourself a gift and be there too. Treat yourself and your associates to the most precious gift of all. The gift of knowledge. Send the Gift Certificate for complete registration, hotel and conference information.

The '72 FJCC. Big, bold and different.

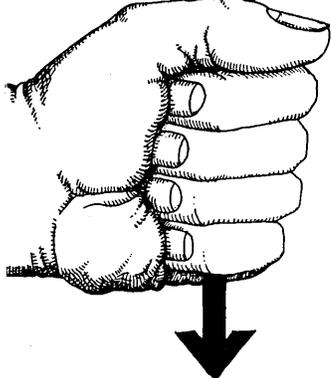

ANAHEIM — DECEMBER 5-7

If you use leased lines, we'll help you use the least lines.

What we'll do is design, furnish, and install for you a Time or a Frequency Division Multiplex System. At multiple locations. Anywhere in the world. The whole works.

All of which, by reducing the number of lines you lease, drastically reduces your costs.

The Singer Tele-Signal Operation, a leader in the field of computer-based communications systems, has done this kind of work for years for military, civilian, and international customers.

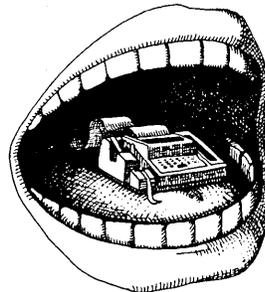

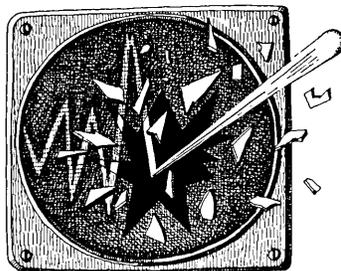

With the multiplexing, you'll need a Data Network Management Center. We'll supply it. A complete monitoring and control facility. One that insures the integrity of the system by rapidly isolating network faults, and thereby increasing traffic throughput.

For Time Division multiplexing, we provide plug-in integrated circuit-card assemblies. They're engineered to give you the maximum in bandwidth utilization.

For Frequency Division multiplexing, we offer plug-in assemblies to accommodate a variety of rates to serve almost any teleprinter and/or data modem terminal hub equipment.

Our multiplexing systems reduce your need for leased lines, and will concentrate a maximum number of channels into one.

Some companies require simultaneous speech and data communications (Speech Plus). We'll supply it. Up to eight data channels operating with speech. Or we can quickly tailor a system to suit your requirements.

We also improve the quality of a voice

channel over a radio path using our linked compressor and expander (LIN-COMPEX). And we have the answer to most of your telephone signaling problems with our universal inband signaling units.

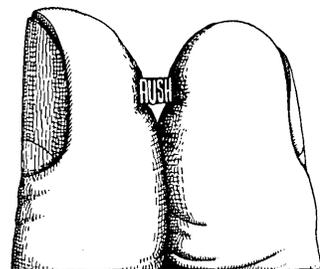

Not the least important part of the system are the modems; these allow your digital devices to talk to each other over telephone lines (leased or DDD). We'll supply them. Many with features not found in their Bell counterparts.

We'll also supply voice privacy equipment, test equipment, and everything else you require to complete your communications system. And we'll provide service and personnel training throughout the world.

We've done all this for such prestigious telecommunications users as RCA Global, American Airlines, Western Union Data Services, FAA, NASA, and the U.S. military services.

So if you're in the market for highly-reliable, complex communications systems and components, check out the Singer line for fast, easy answers.

For information, write: The Singer Company, Kearfott Division, Tele-Signal Operation, 250 Crossways Park Drive, Woodbury, N.Y. 11797 Or phone (516) 921-9400.

SINGER
AEROSPACE & MARINE SYSTEMS

COM FOR PEOPLE WHO NEED A LITTLE LESS THAN COM.

Bell & Howell
Inter/COM.

Sophisticated cathode-ray COM systems are sensational. They are also whoppingly expensive to own.

So Bell & Howell set out to provide computer output on microfilm capabilities without high-cost cathode-ray tubes.

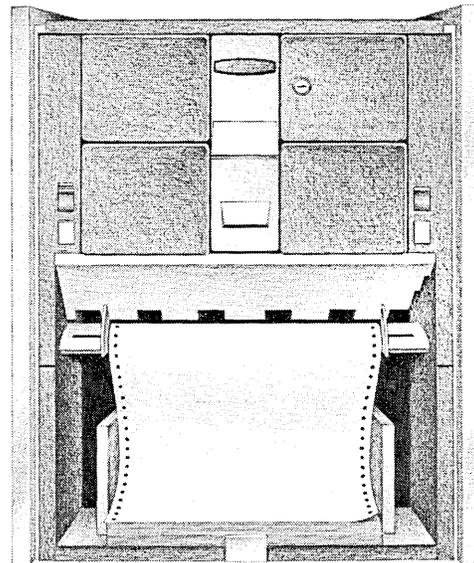

Inter/COM prints microfilm directly from data print-out sheets at 11,000 characters per second. No cathode-ray tubes required.

And while it may not have the blinding speed of cathode-ray COM systems, Inter/COM can give you all the benefits of microfilm, right now.

You can store your computer output data in less space. And distribute it with greater speed and efficiency. All at realistic cost.

Ask your Bell & Howell representative for full information. Or write: Bell & Howell, Business Equipment Group, 6800 McCormick Road, Chicago, Illinois 60645.

At Bell & Howell we draw on our leadership in electronics, training and education and photography to find better ways to make business equipment better.

Before you buy anything, ask to see Bell & Howell.

BUSINESS EQUIPMENT GROUP

BELL & HOWELL

Know how you feel when someone keeps calling you "George" . . . and your name's "John"?

Well, you've got to help us.

Most people know we make an economical, non-impact computer printer.

But if one more person calls our Matrix printer an "ink spitter" or a thermal machine, or anything else that it's not, we're going to yell at the kids. Or

do something equally drastic.

After all, our Matrix printers and plotters are no strangers to computer users. We're operating with hundreds of mini- and midi-computers around the world.

So it's about time someone presented the facts . . . simply and clearly.

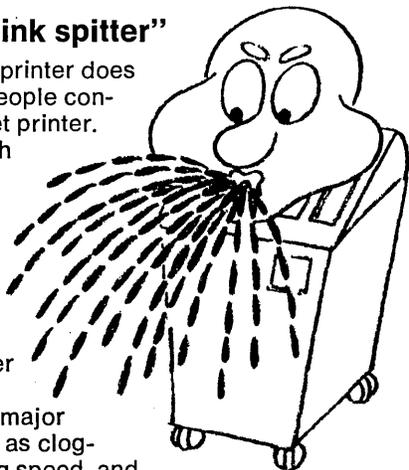

Especially when they can save you a cool fortune.

We're NOT an "ink spitter"

Although our Matrix printer does utilize toner, some people confuse us with an ink jet printer. We're not even fourth cousins.

An "ink spitter" employs jets of colored liquid similar to a fountain pen. The advantages of such a system are: writing on plain paper and low noise.

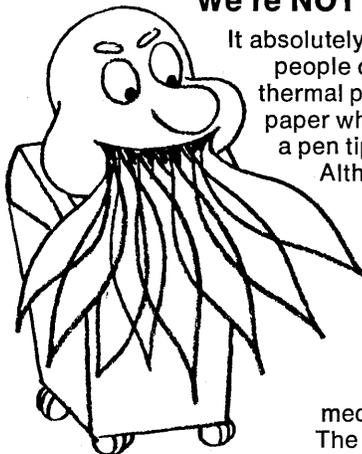

But there are also major disadvantages, such as clogging jets, low printing speed, and poor graphics capability... problems an electrostatic printer never has to deal with.

We're NOT a "thermal printer"

It absolutely astounds us whenever people call us that. Basically, a thermal printer uses a multi-coated paper which, when heated through a pen tip, reveals a black line.

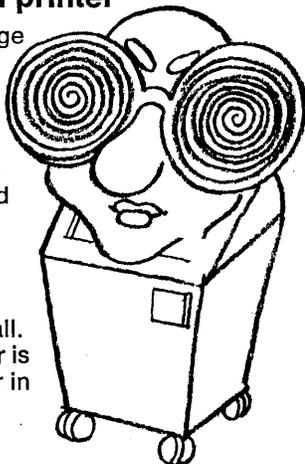

Although it too eliminates problems associated with ink, it has other drawbacks we wouldn't like to live with. Such as an odor and actual debris caused by the burning process, high cost of paper, slow writing, and mediocre output quality. The Matrix printer employs no heat at all.

We're NOT an "optical printer"

There are two kinds. The image is recorded either on paper containing silver, or electrostatically, as in Xerography. In the first case, paper costs are prohibitive and the image is of low quality. In the second case, there are many moving parts and the machines are very expensive.

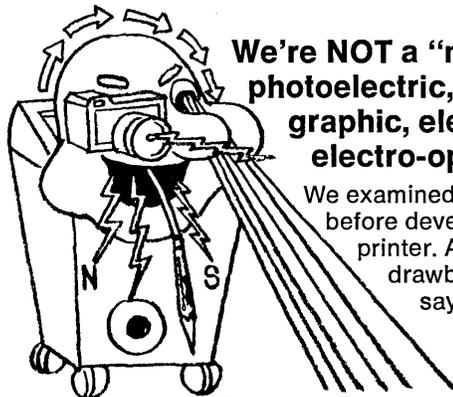

By contrast, the Matrix printer employs no optics at all. The output from the computer is translated directly onto paper in the form of dot matrices.

We're NOT a "magnetic, arcing, photoelectric, electrophotographic, electrolytic, or electro-optical printer."

We examined all these techniques before developing the Matrix printer. And each had its drawbacks. So, when you say, "Oh, yeah, I looked into one of those and didn't like it," we understand.

Because we shared your same experience.

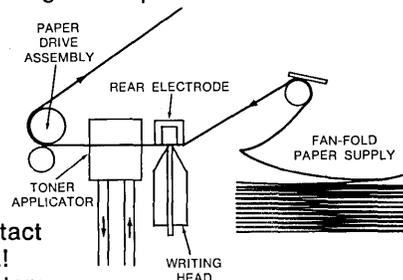

Now do you understand why we get so frustrated every time you equate Versatec's Matrix printer with any of these other devices?

Versatec's Matrix printer explained

We told you what we're *not*. Now we'll tell you what we *are*.

The Matrix Electrostatic Writing Technique (MEWT™) is a *true* electrostatic writing technique. The data travels directly from the computer to a linear array of stationary nibs in a writing head which place a small charge on the dielectric coating of the paper. Immediately, the paper comes in contact with the toner and voila! Clear dot matrix characters... up to 600 lines per minute.

There are no moving parts, jets, hammers, belts, heated elements, traveling electrodes, magnetic dust, odors, blinking lights, noise and other contrivances in the writing method. The only moving part is the paper drive mechanism.

The paper is easy for you to write on (pencil, pen, or felt-tip marker). It has excellent archival qualities. And it can be reproduced easily and clearly on any office copier.

Reliability is infinitely better than with any other device. The average monthly maintenance cost for an impact printer is about *three times* that of a Matrix printer. And, our MTBF is over 3,000 hours. Proof enough?

True electrostatic writing is the first major advance in writing in 20 years.

600 line-per-minute printers for only \$3,900.

Because of the plummeting costs of electronic components, a product that's 75% electronics, such as the Matrix printer, has a beneficial effect on your pocketbook, and it's getting less expensive all the time. By contrast, the thousands of mechanical parts keep high speed impact printers high in price.

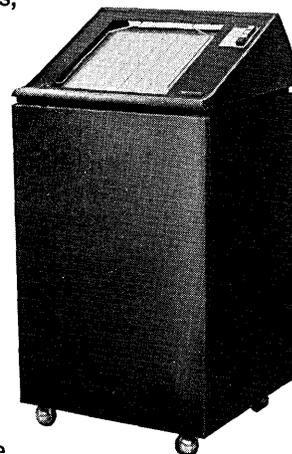

Today, the first breakthrough has already occurred. You can buy the Matrix LP-860 — our 600 lpm, 80 col. wide printer — for only \$3,900. Quantity of one.

Our LP-1150 printer — 500 lpm, 132 col. wide printer — costs just \$4,300. Quantity of one.

In addition, we offer economical controllers for 23 different mini's and midi's.

And these low prices, friends, are yet another major difference between our Matrix printers and most other devices on the market today.

For more information write or call Versatec 10100 Bubb Road, Cupertino, California 95014. (408) 257-9900. TWX: 910-338-0243.

The Matrix printer uses a true electrostatic writing technique (MEWT™). Don't confuse it with anything else.

Think of The Computer Maker.

**What's he really done
to improve your data entry?**

**Think
of Inforex.**

**What we've done
makes us
Number One
in key-to-disc
systems.**

Data entry for computer manufacturers is strictly a sideline.

Not at Inforex.

It's our specialty. Our full-time specialty. Which helps explain why our key-to-disc systems provide the most advanced key entry of all.

Consider. You get CRT display at every keystation, an Inforex first. Makes data entry virtually goof-proof. Discs store up to 128 four-level program formats. And over 2 million data characters. You get concurrent data entry and verification. Balance totalling. Check digit comparison and calculation. Automatic pooling on 7- or 9-track compatible tape.

You get data management like you never had before.

All of which sounds expensive. But isn't. Basic system rentals start as low as \$101 a month per keystation. You can also add system-expanding options, like On- and Off-Line Communications, Line Printing, Reformatting, to name a few.

Our customers include many of the country's largest companies. Companies that take a long, hard look at price. And performance. And supplier stability. And service. What they find has made Inforex key-to-disc systems the most widely used in the world.

When you think of data preparation, think Inforex. The leading specialist in the new and different world of data entry. Contact your Inforex representative. We have offices in major cities throughout the United States, Canada, and Europe. Inforex, Inc., 21 North Avenue, Burlington, Massachusetts 01803.

Hardware

Hardware Notes . . .

We've discovered two more firms whose products qualified for our June small business computer survey (p. 51).

One is the Berg-Haus Corp., of Holliston, Mass., which offers a totally bundled turnkey system based on the Digital Equipment PDP-11. A complete line of peripherals is offered, and there are approximately 50 applications programs available. A 6K model with a 165-cps serial printer, 4-megabyte disc, and 200-lpm printer rents for \$1200/month on a five-year purchase contract. The systems are generally available 90 days ARO.

The Model A system from Linolex Systems, Inc., North Billerica, Mass., also satisfied our criteria. The cpu is a proprietary design that features 2K of 240-nsec 12-bit control storage for instruction implementation, and up to 16K bytes of read/write memory. A full complement of peripherals is offered, and there is a large number of application programs available. These are generally separately priced, with charges typically about \$250. A basic Model A includes 4K of user memory, three cassette drives, crt/keyboard, and a 75-lpm printer, selling for \$14,400. A one-year lease is \$475/month, and Linolex has approximately 20 Model A systems in the field.

Minicomputer prices continue to plummet. Digital Equipment now offers its PDP-8E with 8K of memory for \$5650, down from \$7740. To remain competitive, Digital Computer Controls reduced the price of its D-112 PDP-8 replacement cpu with 8K to \$4750, down from \$5590. The 16-bit mini builders have been active, too. GRI Computer Corp.'s model 99 (in this section) comes with 8K for \$3K each in orders of 25. But the topper of them all is likely Interdata's fifth member of its New Series, the 74. With 8K of memory, 16 g-p registers, and hardware multiply/divide, it's priced at only \$3600, dropping to \$2268 each in an order of any 45 Interdata cpu's.

How safe are data safes? We know of a company that found the source of 56 head crashes and 73 destroyed packs on its Century 100 computer to be a storage safe built with round-headed screws in the drawer mechanism. Each time the drawer was pulled out, filings would drop on the packs and subsequently wind up inside the disc drive. It took one and a half years to discover the source of the problems.

Business System

There's nothing quite like running an equipment survey to find out how many others out there have, or are working on, systems that qualify. That's the case with the Manufacturers Management Control System (MMCS for short) that our June small business issue uncovered (see p. 51). The MMCS is based on a Hewlett-Packard model 2100 cpu, with 12-32K of 980-nsec memory available to support such

applications as payroll, accounts payable and receivable, inventory (complete with bill of material processing and material requirements planning), billing, sales analysis, and many other programs.

A complete line of peripherals is offered to support applications, excluding 96-column card equipment. The operating system requires 16K, but supports eight terminals. Software includes a macroassembler, a time-shared BASIC, and COMFORT (Commercial FORTRAN). A full turnkey system, consisting of 16K memory, crt work station, 100-lpm printer, modem interface, 5-megabyte disc, and customized software for performing inventory management rents for \$1250/month on a five-year lease. There is no charge for installation, training, education courses, documentation, systems analysis, or programming service. Systems are generally available in 90 days. MICROLINE CORP., Santa Ana, Calif.

For information:

CIRCLE 222 ON READER CARD

Display Terminal

The ASCISCOPE crt terminal combines a crt, 110/300-baud modem, 64-character ASCII set, 960-character buffer, and acoustic coupler and rents for only \$63/month. As such, it is bound to be considered as a replacement for model 33 and 35 tty's by users who don't absolutely require hard copy. Or maybe it will wind up being added to those models, as there is a low-cost connection that allows the two to work in tandem. The operator has a choice of page, roll, or block display modes, operator or remote controlled screen erase, etc. An RS-232C interface is

also available for 1200- and 2400-baud operations, and the ASCISCOPE transmits in half-duplex mode. INTERNATIONAL TELEPHONE AND TELEGRAPH CORP., New York, N.Y. For information:

CIRCLE 223 ON READER CARD

360/65 3330 Channel

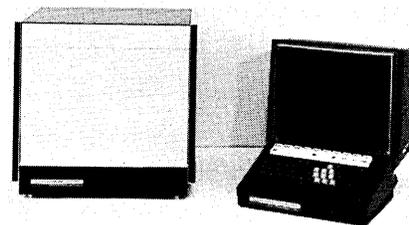

There are numerous purchased 360 model 65s, 67s, and 75s in the world that users might consider keeping if they could realize all the advantages of the 3330-type storage device, with its rotational position sensing, and lower-cost-per-byte storage. The last year has seen announcements of interfaces for the 3330 to these computers, but one key element has often been missing: the block multiplexor channel (IBM 2860) that can accommodate the 3330's high transfer rate of 806 KB/second.

This manufacturer has the channel. It is based on the i/o processor from the Standard Computer Corp. IC 7000, and it's set up to be compatible with OS/360 software releases 20.1 through 21. The Selectoplex channel can also be attached to the 370/165. The purchase price is \$100K, or \$3K/month on a two-year lease. The manufacturer can also supply the 3330s. ALLIED COMPUTER TECHNOLOGY, INC., Santa Monica, Calif. For information:

CIRCLE 224 ON READER CARD

Crt Display

The Videomaster 7100 is a stand-alone remote display terminal said to be plug-to-plug and logically compatible with the IBM 2265. It's based on a 12-inch diagonal crt that displays up to 24 lines of up to 80 5x7 dot-matrix characters

(maximum of 1,920 characters), with the display being refreshed at 60 Hz. A format mode permits fixed- and variable-length fields to be constructed through the terminal. The software also generates a "fill-in-the-blanks" format to ease data entry, and there is data insertion/deletion of characters, aided by a cursor. Options include a

From any angle, it's easy to see why Key OEMs are choosing Interdyne's digital cassette drive.

Servo-controlled capstan drive means hundreds of millions of repeatable start/stop cycles with no mechanical adjustments.

Three precision, direct drive motors - no belts or clutches anywhere. That spells reliability and low maintenance.

Two compact circuit cards can plug into transport or be located up to 6 feet away.

Rigid, heavy duty castings and one moving mechanical part contribute to a calculated MTBF of over 7500 hours.

Pressure pad by-pass*, precise guiding and repeatable tape tension yield error rates of less than 1 in 10⁸ bits.

Meets or exceeds ANSI/ECMA-34 standards. Complete interchangeability of cassettes and drives.

The little gem weighs 2 lbs. 6 ozs., uses 16 watts and is 4 1/4" x 5 1/4" x 5".

OEMs can't afford a mistake when choosing a digital tape cassette drive. They know that the rent stops on their system when even the smallest peripheral is down.

INTERDYNE's drive, along with scores of others, has been evaluated by the largest makers of point-of-sale recorders, remote terminals and digital systems. And time after time the IC 2500 has been rated tops for performance and reliability. Frankly, we're not surprised. The IC 2500 is a classic in simplicity. You

won't find the usual, complex assortment of mechanical levers, banging solenoids and belts. Just a DC capstan motor and a pair of reel motors to precisely control tape velocity and tension.

A velocity controlled servo capstan drive system achieves gentle, precise tape handling, just like the big reel-to-reel machines. We've even gone them one better by replacing the digital tachometer with an ingenious back-EMF sensing servo circuit.*

The IC 2500 handles data synchronously

up to 9600 bits per second, or incrementally to 30 char./sec. And try this spec on the other guys: Bi-directional Write/Read at either of 2 remotely programmed speeds between 2 ips and 12 ips with optional 40 ips search.

The word is spreading fast. From any angle the IC 2500 reflects simplicity and performance. Find out more today.

 dataphone 4800

ON

RS CS

CO ER

AL DL

Introducing the 4800, first in a new family of data sets from the Bell System.

The Bell System's new 4800 data set is designed for transmission at 4800 b.p.s.—and it's economical.

This set cuts transmission costs three ways. First, the charge for the set itself is low.

Second, it makes it possible to transmit at 4800 b.p.s. over basic private line facilities—an automatic equalization feature corrects for variations introduced in the transmission channel.

Third, it uses your computer time economically. In addition to its high bit rate, it also features rapid startup and turn-around. The time from “request to send” to “clear to send” is less than 50 milliseconds in switched carrier operation. That makes the 4800 particularly well suited for multipoint polling applications.

In addition to speed and economy, this new data set also offers convenience. Local and remote loop-back testing is accomplished by operating a three-position test switch. Seven lamps on the front panel indicate the status of the set at all times.

And solid-state technology from Bell Laboratories fits all these features into a compact housing 16 by 11 by 4½ inches.

For details on the new “dataphone 4800” data set, including its low price, call your local Bell System Data Communications Consultant.

AT&T and your local Bell Company.

row of program attention keys that can request the application programs' 10 most-used functions, and two optional buffered printers (impact, nonimpact, or both that can be hooked up to a single terminal). The character set is ASCII, 64 characters. Including installation and maintenance, the 7100 rents for \$125/month, with initial deliveries under way. GTE INFORMATION SYSTEMS, White Plains, N.Y. For information:

CIRCLE 225 ON READER CARD

OCR Line Printer

The creation of utility bills, insurance statements, and other documents that take advantage of machine-readable ocr characters should be eased by using a combination alphanumeric and ocr line printer available for this manufacturer's Century 200 computer. The printer is available in line widths of 132 or 160 characters and prints its 41 regular characters and 23 ocr characters at up to 1,500 lines/minute. A two-position switch on the printer selects which character set is used. Since the printer cannot print ocr and standard font in the same pass, two passes must be made to put both types of print on documents. Rental on the 132-column unit is \$1300/month; the 160-column version is \$100/month more. Maintenance on both models is \$120/month. NCR, Dayton, Ohio. For information:

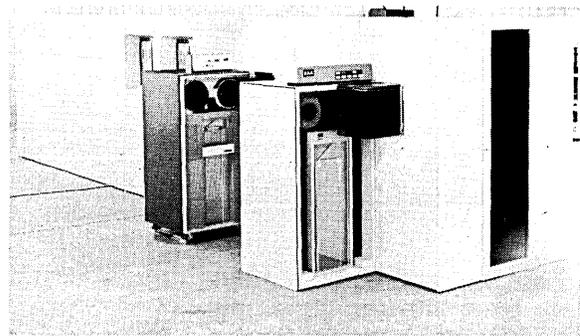

CIRCLE 226 ON READER CARD

PDP-11 Disc Storage

The rapidly growing list of Digital Equipment Corp. PDP-11 owners is offered a variety of disc storage combinations that appear to offer dramatic cost savings. Fixed-disc, removable-disc, fixed and removable discs in the same drive, and combinations of separate fixed and removable drives (with common controller) are offered, providing storage sizes ranging from 64K 16-bit words to over 6 million words of storage. Average access times are either 8.35 or 16.7 msec for fixed-disc units and 60 msec for the removable-cartridge (IBM 5444-type) unit. Transfer rates are roughly 240,000 words/second for fixed-disc units; 100,000 words/second for the removable-cartridge versions.

A typical configuration, including a 2.5-megaword cartridge drive in combination with a 256K-word fixed-disc platter beneath it, would run about \$14,950 with controller and compete favorably with the \$30,500 RK0 package. In the combination configuration, both the fixed- and cartridge-drive units can be transferring data at the

product spotlight

Automatic Tape Library

The concepts of reducing installation support personnel and cutting down the time it takes to get tape files mounted on computers continues to spur automatic tape library development. But perhaps the consideration that will really create a market for these devices is the one of security. With the tapes stored in a vault-like structure, there's less chance of malicious mischief, and that's a thought on most dp managers' minds these days.

The ATL-1 is the latest automatic tape library management system to come to our attention. At the heart of it is a Digital Equipment Corp. PDP-11, receiving commands from the host 360 or 370 selector or block multiplexor channel (respectively) to locate and automatically mount tapes on IBM 3420 self-loading drives—or equivalent. The PDP-11 keeps track of tape generations and cooperates with the JCL at the computer to make sure the correct file gets mounted. Tapes are

automatically scratched by generation or expiration date, and when the system calls for a scratch tape, the PDP-11 knows which one is the least recently used. And tapes are always transported to the nearest available drive. For tapes that are not cataloged, there is a pick-up port for these tapes to be entered when the JCL asks for the mount. In all, it seems to be a fairly well thought out product, requiring no changes to the host computer operating system.

The basic two-drive system is priced at \$85K, or \$1840/month on a three-year contract. A system that serves eight drives is approximately \$170K and rents for \$3590. Models for serving up to 32 tape drives can be supplied. The first unit is scheduled to be shipped next month, with quantity shipments slated for next June. XYTEX CORP., Boulder, Colo. 3330 Storage for 360s

This is the second 3330-type storage system we know of that includes the block multiplexor channel allowing 360s above the model 65 to get all the performance out of the 3330. Additionally, this one is offered to the 360 model 30, 40, and 50 user, with software patches supplied by the vendor to "blind" the cpu and the 3330 from looking for multiplexor channel. (The 65 model requires no software patches.) If the user subsequently upgrades the installation to a 370, the same 3330 can be retained by the customer, but the disc controller adapters must be changed. Prices for the disc storage system are the same for all units: \$6015/month on a three-year lease for a full 800-megabyte eight-drive configuration. The 360/65 version can be delivered next month, with November slated for the smaller mod-

els. COMPUTER INVESTORS GROUP, Stamford, Conn. For information:

CIRCLE 228 ON READER CARD

Minicomputer

Texas Instruments has made a bid for a larger share of the general-purpose minicomputer market with the announcement of the 980A. It's said to be just the thing for systems designers to use in building data communications, communications preprocessing, scientific, and small business dp products—though the machine does not have decimal arithmetic. The basic 980A has 4K 16-bit words of semiconductor memory (expandable to 64K), hardware multiply/divide with double-precision instructions, dynamic memory management, power failure automatic restart, a 333K word i/o transfer bus with four ports (expandable to 13 in the basic chassis), a one-megaword DMA channel expandable to eight ports, four hardware-vectored priority interrupts (expandable to 64), bit/byte/word/string addressing, 89 operation codes, eight general purpose registers, etc. All for \$3475. The software

library includes FORTRAN IV; assembler languages; link and source editors; an executive that manages disc storage; IBM 360/370. cross-assemblers; and TILT, a proprietary TI high-level macro language. Initial deliveries of the 980A have been made. TEXAS INSTRUMENTS INC., Dallas, Texas. For information: CIRCLE 229 ON READER CARD

POS Terminals*

Singer, the acknowledged leader in number of point-of-sale terminals with approximately 9,000 units in 500 store locations, has announced two additions to the basic MDTs (Modular Data Transaction System) that has been in the field more than four years.

The new models, the 902 and 925, can be programmed for positive and negative credit assessments, make multiple copies of sales checks or cash

receipts, and provide an original audit tape of each transaction. The 925 differs in that it has a side insertion printing capability with a full alphanumeric printer with two print heads that independently produce an audit tape and a receipt of the transaction. Both models also feature selective itemization, tax table look-up, check for a minimum and maximum number of entry digits, and keep track of transaction counts.

Current MDTs units can be upgraded to model 902 specs in the field for \$300 per terminal. The 902 may be purchased for \$3200; the model 925 sells for \$3500. The 902 and 925 will be available in the first and second quarters of next year, respectively. THE SINGER CO., New York, N.Y. For information:

CIRCLE 230 ON READER CARD

Modem*

The model 412/424/436 is a modem cabinet that can be equipped with a number of field-installable pc cards for 1200-baud asynchronous shift key, or 2400 and 3600 phase-shift keyed oper-

ation. As such it is compatible with the Bell 202 and 201B modems, as well as standard EIA and CCITT interface specifications. The manufacturer claims the model is the first one with digital integration of both the transmitter and receiver, accomplished with a unique digital wave form synthesis technique, resulting in the elimination of maintenance. The basic model 412 is \$580; the pc card for 2400-baud is an additional \$370; and the 3600-baud card is an additional \$650. There are options for secondary data channels, remote loopback control, automatic equalization (standard on the 436 card) dial-up back-up, and auto answer. AMERI-

Along with some of the newest and most sophisticated modules in the business.

Because we're big and bright enough to stockpile and document every advance we make so that when we obsolete a module, we don't obsolete what you're doing with it.

We promised to back up the first module we made back in 1957.

You buy the same module today, we'll make the same promise.

And we'll let you buy as little

as one or two at a time, anytime you need them.

Which is one reason why a lot of people like you, like doing business with us.

And one reason why it really isn't worth your time, trouble and talent to try to make them yourself.

Fifteen years ago, we sold our first module.

One more thing.

Every module we design, we design more conservatively than any other module maker.

Which is why we can back them up longer, unless you try to make them do something they weren't designed to do in

the first place.

In which case, we could design you a special one, to do whatever you want it to do.

Like interfacing one of ours or anybody's computers.

Which is one more thing we've been doing better longer than most people have been in the business.

We're the Logic Products Group, Digital Equipment Corporation, Maynard, Massachusetts 01754, (617) 897-5111 (Ext: 2785) in the U.S.

Reader for TTY's

It seems as if independent manufacturers are developing equipment for the venerable Teletype products to lengthen their useful lives in much the same way as was done for the 360 product line. As an example, here is an 80-column card reader that plugs into the RS-232 connection on the back of the tty ASR models 33 and 35, which would allow card decks that didn't require any changes made during input to be fed directly into the computer. The device comes in two models: a model 4010 for transmission at 10 cps, and the model 4030 for 30-cps operation. The price for either version is \$3800 and includes all necessary cables. PIVAN DATA SYSTEMS, INC., Lincolnwood, Ill. For information: CIRCLE 236 ON READER CARD

Modem Sharing

The LSD-6 allows collocated terminals—running at rates up to 9600 baud in a communications network where the cpu is polling the terminals—to share a

single modem. The unit is inserted between the RS-232B/C interface of the terminals and the modem. Additional LSD-6 units can be hooked up behind the first one to support 11, 16, or more terminals. The code-transparent device is priced at \$785, or \$30/month on a one-year lease. RIXON ELECTRONICS, INC., Silver Spring, Md. For information: CIRCLE 237 ON READER CARD

Oem Cpu's

Lockheed Electronics continues to edge toward entry into the business systems manufacturing market. In support of that plan, a decimal and a scientific-oriented cpu have been developed, supplied in pc card form for other system designers. These cpu's are additions to the basic SUE (System User Engineered) components announced last year, which consisted of a 16-bit mini with 4-32K of 900-nsec memory with instruction sets for accommodating assembly, FORTRAN, BASIC, and RPG languages.

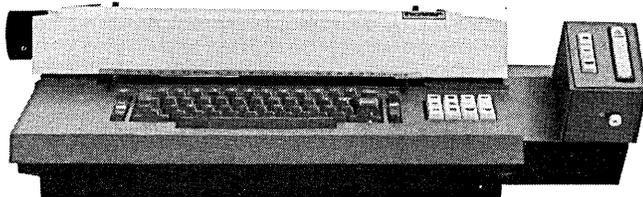

The model 1111 cpu knows 109 instructions, excluding addressing permutations, with decimal commands for doing addition, subtraction, multiplication, and division of 4-digit packed words. A maximum field of 29 digits can be handled for these operations. Also in the decimal set are clear/add

decimal, right and left decimal shifts, and pack/unpack word, compare decimal, left/right character string shift, and string compare. These are all very common business processing instructions, so the 1111 should at least be considered by companies interested in entering the business processing sector. For information: CIRCLE 238 ON READER CARD

The scientific pc board—the model 1112—has 126 instructions, including arithmetic, eight for double-length shift that operate on 32-bit words, eight normalize and count instructions, and seven for bit manipulation and logic. Both the scientific and the decimal cpu's are priced at \$1495 and will be available in November. LOCKHEED ELECTRONICS CO., INC., Los Angeles, Calif. For information: CIRCLE 239 ON READER CARD

Batch Terminal

The model 74 batch terminal is the first such unit from this manufacturer that has incorporated a minicomputer; the predecessors were hard-wired units that could only handle a single communication line discipline. And although the user of the 74 can't get at the programs the mini stores, the computer does allow the terminal to act as a 2780; a 360/20, 22, or 30 under

Tapes made on Novar off-line source data devices, including the 5-30 Automatic Tape Typewriter and 5-12 Recording Typewriter, can be transmitted via telephone lines by playing them on Novar 5-50 or 5-60 communication terminals. The 5-50 transmits in the Selectric correspondence code, the 5-60 in the ASCII code. Transmission rates available up to 2400 baud.

Systems range in price from a 4K unit, including tty, for \$10K, to a more typical configuration containing 16K memory, disc operating system, a fixed- or moving-head disc, tty, and high-speed paper tape reader/punch for \$30-35K. Delivery is scheduled for October. PRIME COMPUTER, INC., Natick, Mass. For information: CIRCLE 244 ON READER CARD

Audio Response Modem

The DMC/403 is a Bell 403D5, DLL, E3, or E-6 type data set on a single pc card. It accepts Touch-Tone or other "2 of 8" codes, and is intended for incorporation by oem's into audio response systems. The 403 can decode up to 10 digits per second. It's claimed that 24 of these modems require less space than one conventional 403 data set. The price per unit is \$710. PERIPHONICS CORP., Bohemia, N.Y. CIRCLE 252 ON READER CARD

Cassette Storage*

A 1-megabyte dual-transport cassette subsystem is now available to users of the Interdata New Series processors, including the model 50, 55, 70, 74, and 80.

A block of data received in 1 minute by teletypewriter can be received, stored or retransmitted by a Sykes 2220 EIA (RS232C) and CCITT-compatible Cassette Tape System in 5 seconds!

That's because it transmits at 1200 baud asynchronously or 12 times as fast as a teletype machine, cutting computer time, operator time and 55 seconds of line time. Synchronously, it operates at up to 5400 baud for even greater savings.

It also saves by receiving and storing data all day and transmitting, by remote

command, at low night line rates.

The Sykes 2220 Cassette Tape System, an important advance in data handling, storage and retrieval, was designed to increase the efficiency and flexibility of all terminals, especially paper tape systems. In addition to speed, you'll have storage capacity of 720,000 characters and keyboard control that lets you read, write, backspace, skip records, skip files and search at high speed.

You can copy, certify, delete, edit, monitor incom-

ing and outgoing transmissions, handle unbuffered terminal output and permit another terminal to poll or transmit data to your site after hours.

The Sykes 2220 Cassette Tape System is the answer to increasing data communication complexities and costs. Write today for your free brochure and see how short a minute can be.

CIRCLE 108 ON READER CARD

There is hardware read-after-write check, signal drop out detection, and other error checks. The transfer rate is up to 1,000 bytes/second from the twin Philips-type cassettes operating at 10 ips. The recording density is 800 bpi. The price is \$4200. INTERDATA, Oceanport, N.J. CIRCLE 251 ON READER CARD

Data Error Correction

Users of 4-wire, full-duplex, synchronous data transmission networks that run at speeds up to 9600 baud might be interested in the Validata 9100, which is inserted between a terminal and a modem on the network. The code-transparent unit then adds a bit combination to the data to help ease line noise, line drop out, and loss of modem synchronization. A decoding unit on the other end of the line detects and corrects such errors. For orders of six units or more, the Validata 9100 rents for \$1/day on a five-year contract. INTERNATIONAL DATA SCIENCES, INC., Providence, R.I. CIRCLE 245 ON READER CARD

Source Data Collection*

The Source 1000 is a battery-powered portable data collection terminal, related to one of this firm's earlier products. But the 1000 stores numeric characters only in its 2K or 4K semiconductor memory, entered through a 16-key keyboard. A third component of the 1000 is a combination battery charger, acoustic coupler, and transmitter unit. The information stored in the portable memory is read into the transmitter unit, where it is converted from 4-bit representation into 8-level ASCII. The price for one set (keyboard, 2K memory, battery, and transmitter combination unit) is \$800. An additional 2K of memory adds \$240 to that price. MSI DATA CORP., Costa Mesa, Calif. CIRCLE 246 ON READER CARD

Commo Processor Option

A high-speed option offered for this manufacturer's CT/90 communications processor is said to increase that unit's throughput by a factor of five and should help the 90 qualify for large-scale applications it couldn't tackle before. The option is actually a second processor for the 90, a 16-bit microprogrammable mini that can add two 16-bit numbers in two's-complement fashion in 160 nsec. The estimated throughput for the 90 with this option is 20 KC, or roughly 200,000 bps. This rate may be distributed among up to 256 lines varying in transmission rates between 40 and 50 kilobaud. The high-speed option is priced at \$17K, and can also be leased along with the CT/90. Delivery is 90 days. COMTEC DATA SYSTEMS, INC., Hawthorne, Calif. CIRCLE 247 ON READER CARD

TTY Replacement

Users of the model 1401 tty magnetic tape terminal are offered an IBM Selectric typewriter set up to work with the tape unit on that configuration. The Selectric is called the model 37T KSR, and it rents for \$93/month. The user continues to pay Teletype Corp. the \$112 monthly rental on the tape unit. For an additional \$40/month, customers can obtain the Bell

202C data set that permits 1200-baud transmission. TYCOM SYSTEMS CORP., Pompton Lakes, N.J.
CIRCLE 248 ON READER CARD

Card Reader
The addition of a card reader to the catalog describing this vendor's model 800 and 1600 minicomputers should just about complete it, for numerous other peripherals have been announced for it lately. The reader, based on a Bridge Data Products mechanism, is rated at up to 300 binary and Hollerith cards/minute. The price of \$4100 includes the reader, controller, and necessary cables. The reader is available in both table and desk-top versions. MICRODATA CORP., Santa Ana, Calif.
CIRCLE 249 ON READER CARD

Modem*
The model 403 modem is billed as being programmable, which, in this case, refers to the ability to field-strap the unit to any asynchronous line rate up to 300 baud. The interface is RS-232-C and CCITT for European use, and the unit is compatible to the Bell 103, for answer or originate on two-wire operations. The unit can also be field-strapped to look like a 103A, 103E, or 103F. In pc card form, it sells for \$400; add \$150 for the complete unit, including enclosure. Delivery is 25 days. AMERICAN DATA SYSTEMS, Canoga Park, Calif.
CIRCLE 250 ON READER CARD

Modem
The model 920 is an originate-only acoustic coupler compatible with 0-300 baud Bell 103A-type modems. It contains its own power supply and wood cabinet and can be used with any terminal having the standard RS-232 plug and using half- or full-duplex communication modes. A carrier detect light is standard on all units, and each comes with a direct access arrangement. The 920 is priced at \$99.50 in any quantity. TYCOM SYSTEMS, CORP., Pompton Lakes, N.J.
CIRCLE 253 ON READER CARD

Cassette
The model 143 cassette is a serial unit that incrementally records at up to 3 ips on Philips-type cassettes. It incorporates a positive reel take-up clutch, capstan drive mechanism, and positive traction reel drive hubs. All i/o interfacing is TTL logic, and there is a baud buffer that can be set to accept and generate data in RS-232C format at 110, 300, or 600 baud rates, in 10- or 11-bit format. The single unit price is \$875. MEMODYNE CORP., Newton Upper Falls, Mass.
CIRCLE 263 ON READER CARD

S/3 Disc Cartridge*
The model 5440 disc cartridge operates on IBM 5444 type drives. The recording surface is a proprietary aluminum alloy substrate and coating that is then heat treated and polished. The manufacturer claims this process allows the 5440 to perform reliably through 6,000 head loadings with a minimum of maintenance.

*European distributor has information on this product.

Priced at approximately \$145 in small quantities, the cartridges are warranted for three years. Delivery is immediate. CFI MEMORIES, INC., Anaheim, Calif.
CIRCLE 257 ON READER CARD

MAC Bootstrap
A solid-state diode-matrix bootstrap memory is available for the popular MAC 16 and MAC Jr. 16-bit minicomputers. It can hold up to 64 16-bit words and is programmed by inserting a diode to represent each "one" in a word. The cycle time is 1 usec for each word. The unit can be used to load programs from tty's, paper tape readers, tape units, and communications equipment. A circuit board with 500 diodes is priced at \$550. LOCKHEED

ELECTRONICS CO., Los Angeles, Calif.
CIRCLE 261 ON READER CARD

MAC Read-only Memory
The model MP69632 alterable ROM offers users of the Lockheed MAC 16 from 4K of 160-nsec access (500-nsec cycle time) memory, complete with all interface and control electronics, which is installed by removing the back panel of the 16-bit mini and inserting it into one of the interface slots that holds the regular read/write memory. Pricing across the entire capacity range is approximately 1¢/bit, and availability is four weeks. DATAPAC INC., Costa Mesa, Calif.
CIRCLE 262 ON READER CARD

Here's a display terminal you can rack mount, or desk-top, or remote keyboard. How convenient!

It's the LSI 7700A, available in three configurations to fit all OEM requirements or end user applications. But if you think the packaging is convenient, just look inside. New "cursor read" capability tells the computer at all times where the cursor is located. The protect mode covers the entire display, allowing any or all characters to be retained. Blink control also applies to all characters. And of course, as with all 7700 Series Displays, the 7700A has total editing capability. Before you invest in any display terminal, write or call for complete 7700A specifications.

Software & Services

Software Notes . . .

Many companies are using 360s and 370s for running up to 80% of their jobs in 1401 emulation mode, says International Resource Development, Inc., Ramsey, N.J. IRD has just reached an agreement with Com-Stute, Yokohama, Japan, whereby IRD will send 1401 Autocoder and SPS (Symbolic Programming System, wasn't it?) programs to Japan for line-by-line conversion to 360 BAL by Com-Stute's 40 programmer staff. The charge is \$11 per statement, not including any file organization changes. While the charge seems high, it's claimed that machine performance at installations doing a great deal of 1401 emulation will improve enough perhaps to stave off the need for a larger, or more powerful system. IRD points out that installations seldom get around to doing conversion because it is the most tedious programming job. Perhaps they're right, as IRD claims three customers for the new service already.

Southern hospitality includes giving computer programs away—or at least some folks in Georgia think so. One is Governor Jimmy Carter, who offers a set of computer programs to other state and local governments to simulate cash flow and automatically determine which investments for collected monies will yield the highest amount of interest. The Governor states that the programs recovered their \$105,000 development costs in their first month of operation.

Digital Communications Associates, Inc., also in Atlanta, is offering the FOCAL language to PDP-8, 10, and 11 users; and a set of diagnostics called DSP-8 for only the cost of duplicating a DECTape—typically \$10-20. DSP-8 contains I/O routines, scope loop commands, data comparison routines, etc. DCA has just recently set up shop to do small custom computer applications involving both hardware and software.

Robert P. Henderson, vice president and associate general manager of Honeywell Information Systems' North American Computer Operations, sees the annual revenue from network data processing services in North America tripling to more than \$1.5 billion in 1975, compared to about \$420 million in 1970. "The general business segment of network services will grow the fastest, to about \$600 million, or 40% of the 1975 figure, compared to 1970's \$55 million, or 13% of the revenue."

Report Generator

The DYL-260 report writer/composer is a difficult product to classify generically. It's more powerful than a simple report writer and appears to be an embryonic form of a true file management system. It can't be used to construct a ring-type data file relationship, but it can be used to build variable- or fixed-length ISAM files and sequential files on tape or disc. It can also perform such utility functions as batch balancing, file reformatting, data packing, and a good bit of reporting.

The developer's target in developing DYL-260 was the "quick-and-dirty" COBOL and RPG program that is written perhaps once to obtain a very specific report and then probably tossed into the circular file. To do this it was necessary to equip 260 with approximately 50 modules that take their cues from a special report generation parameter sheet. (This sheet also serves to document the run.) DYL modules then scan one or two selected files, edit the data, calculate formulas that can be entered on the parameter sheet, and then produce the report (one report per pass for now). An interesting point about the equation processing is that DYL-260 scans the equation from left to right and performs the operations in the sequence they are indicated—no parenthesis to try to balance.

Perhaps the best way to illustrate DYL-260's capability is with a typical example: produce an employee-by-cost-center report with three levels of control totals and 17 report fields. The DYL package required 32 cards, compared with a 349 statement COBOL program. The COBOL program compiled in 35 seconds, link loaded and executed in 1.9 seconds on a 360/50. The complete DYL-260 run required only 1.2 seconds on the 50.

There are DOS and OS versions supplied in object deck form on tape, and the package will run on any 64K 360 above the model 25. The program rents for \$2.60/day (\$80.60/month) or can be purchased for \$8K. DYL-260 is scheduled for delivery next month. DYLAOR COMPUTER SYSTEMS, INC., Van Nuys, Calif. For information:

CIRCLE 275 ON READER CARD

Forecasting

A forecasting package for use with periodic data is available in BASIC or in FORTRAN, and comes adapted for the user's particular time-sharing service. EXPSMOOTH interactively accepts 24 data points or more which describe the past data values, smooths the data

about 10 times using polynomial and trig functions, then projects up to five years of future data. The program operates in less than 8K bytes and is priced at \$500. It is expected to be used primarily for short-term forecasts, especially in manufacturing and marketing. STEVE BACHMANN & ASSOC., Costa Mesa, Calif. For information: CIRCLE 276 ON READER CARD

Data Base Management

More and more foreign software packages seem to be emigrating to the U.S. The latest arrival is a data base management system from Australia, developed by a group dissatisfied with the IBM BOMP and DBOMP (Bill of Materials Processors). The ISOGEN package is said to have virtually no limitations on the range of logical relationships that can be established between data segments; linkage may be maintained in any direction. There is a range of file structures available, accessible by PL/1 or COBOL application programs. The developers claim it has much the same facilities as the IBM-supplied IMS but requires less memory both because the nucleus is smaller and because ISOGEN requires only the portion of the data base actually being processed to occupy memory.

The DOS version of ISOGEN occupies 28K, and the COBOL programs it generates typically require 2-3K bytes per file being processed within the data base. The OS version requires 70K bytes, and generates programs typically requiring 3-4K bytes of memory. ISOGEN can be purchased for \$17K, and can also be leased. It's currently being evaluated by several firms in the U.S. NATIONAL COMPUTER ANALYSIS, INC., Princeton, N.J. For information: CIRCLE 277 ON READER CARD

ISAM Replacement

IBM 370 users will have a choice of access methods to replace ISAM—IBM's own VSAM or this vendor's TAM (The Access Method). TAM has the added advantage that it can be used on 360s also. Reorganizing disc files with TAM will reportedly make for faster updating and packing 20%-40% more data in the same disc space.

TAM provides indexed sequential access to 2311, 2314, or 3330 fixed- or variable-length records. It works under unmodified DOS or OS, eliminates most overflow linkage, handles duplicate keys automatically, keeps access statistics, and can retrieve records by the next higher key than the one specified

There's a hole in your data entry/input system.

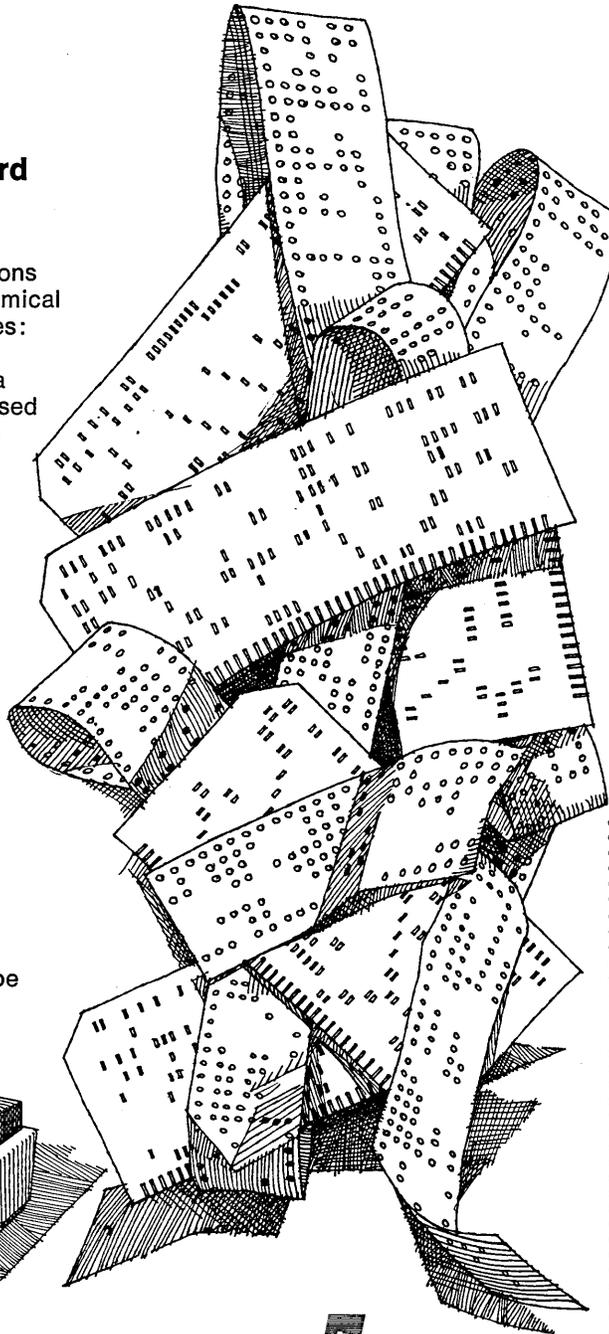

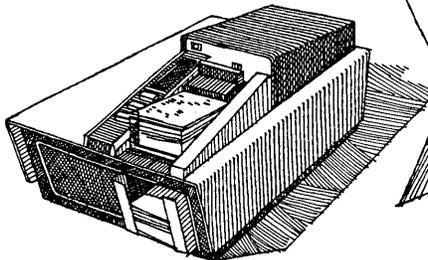

Or didn't you know?

Get your data out of the hole... use one card to do the work of two.

Now you can bypass time consuming keypunch operations with the simplest, most economical of all data entry/input devices: pencil and paper. Start by sketching us your ideas for a tab-sized card that can be used as a data entry form. Keep in mind that once the form is marked in pencil it's going to be used as a data input card, too. That's because the marked card will be read by Hewlett-Packard's Optical Mark Reader, and the data fed continuously, or on demand, into your computer. Quickly and quietly. Local or remote.

A custom card design will leave some punch in your system

We'll study your sketch, then help you get it converted into finished cards. If you like, repetitive data or codes can be pre-punched. The Reader senses holes as well as soft-lead pencil marks.

She's better looking and tries hard, but...

she can't match our desk-top Optical Mark Reader for accuracy, reliability and economy. And if it's not just right for your specific application, we'll customize it. To get a data sheet use the coupon. You may even want to attach an entry-input card sketch.

(as in alpha ordering). Installed in 15 minutes, the program product can be leased for \$300/month or \$7500 for three years. INTERNATIONAL MANAGEMENT SERVICES, Hacienda Heights, Calif. For information:

CIRCLE 278 ON READER CARD

Disc Dump/Restore

This utility offers users a way to free up some disc spindles or to keep more up-to-date backup copies of disc files. Called Fast Dump Restore, it reportedly dumps 2314- or 2319-compatible disc packs to tape in 15% to 30% of the time required by the IBM OS utility. Its vendor claims that a "typical" pack is dumped in from 2½ to 4½ minutes, that full packs take between 3½ and 7 minutes, and that restore times are always less than dump times. Further, the program requires 40% less mag tape (meaning that full packs can usually be dumped onto a single reel). A 30-day free trial is offered, after which \$990 is payable for the first copy and \$500 for each successive copy. INNOVATION DATA PROCESSING, Flanders, N.J. For information:

CIRCLE 279 ON READER CARD

DOS Courses

For those expecting to stick with DOS in spite of attempts to lure them away, this vendor offers a 12-lesson videotape course in DOS' architecture and operation. JCL is covered, along with service functions like Linkage editor, data management facilities, and advanced features such as multiprogramming and multitasking.

Offered for purchase for under \$1500 after a 30-day preview, the course is also available on a subscription basis which allows the user to trade it in, when finished, for one of 50 other courses. EDUTRONICS SYSTEMS INTERNATIONAL, INC., Los Angeles, Calif. For information:

CIRCLE 280 ON READER CARD

Pert/Cpm Service

IMPACT (Integrated Management Planning and Control Technique) is billed as being a more powerful and flexible version of the popular PERT/TIME and CPM programs. It includes features such as controlled cost crashing to ascertain the best way to expedite a project for a specified cost, and resource leveling to smooth the peaks and valleys in resource usage by automatically shuffling nonessential

jobs. The service is run from a Honeywell 435 computer, and the FORTRAN IV program generates a 72-character-wide report suitable for Teletypes. The charge is 6¢ per CPU unit, or, typically, a 100-activity network run costs about \$12. No plots are generated at present. RAPIDATA, INC., Fairfield, N.J. For information:

CIRCLE 281 ON READER CARD

Financial Statements

This unnamed package is for planning, budgeting, and cost control. It produces monthly financial statements and year-to-date figures for income, taxes, cash flow, balance sheet, financial ratios, debt coverage, and earnings/share. It compares previous, actual, and budgeted figures, then projects figures for the remaining months in a year and for year-end results. It operates on three levels of statements, including company or division, groups of companies or divisions, and corporate. Written in FORTRAN, the program requires 120K unless it is overlaid. It leases for \$150/month or can be purchased for \$9000. STEVENSON & KELLOGG, LTD., Vancouver, B.C. For information:

CIRCLE 282 ON READER CARD

Cobol Tracing*

For those computers not equipped with adequate COBOL tracing routines—which this vendor claims include some CDC, NCR, and ICL machines—RSTRACE is offered. Object decks RSTRACE produces allow programmers to enter, at run time or at compilation, a list of paragraphs or groups of paragraphs to be traced. The program inserts TRACE statements and routines into the COBOL source, causing the paragraph names to be printed as the code is executed. When being used, RSTRACE turns off any tracing called for in the source code. It also can list and resequence decks and optionally provides for printing the last N paragraphs executed before an abnormal termination.

RSTRACE requires 40K-60K words if all features are implemented, and sells for \$1000 to \$2500 (\$40/month to \$80/month on lease) depending on installation size. ROBERT SHERRY & ASSOC. LTD., Lancs., Eng. For information:

CIRCLE 283 ON READER CARD

DP Auditing

Eleven kinds of audits can be made of a DP facility through this specialized service, including ones for software design, new applications, existing applications, technical procedures, documentation, operations, personnel, DP

*European distributor has information on this product.

objectives, dp equipment, software procurement, and product specifications (for hardware and software manufacturers). These audits are all available on a fixed-price, fixed-time basis where the only variable expense is the per diem.

As an example, a review of an existing application would include a technical and economic analysis of its expected life, its effective cost to modify, its cost to replace, and its potential enhancements. Recommendations are made for changes in the system and its operation and controls; and the costs of those changes are estimated.

The price for the service depends on the application size. A 360/30 general accounting system review might run as much as \$15,000. Also, for objectivity,

three DECTapes, and a tty. A disc version of SORT3 is also offered. To use it, the user enters parameters via the tty, detailing which fields will be sorted, file names, etc. An employee file with 400 records (each 128 decimal words long, unblocked in complete reverse order) is said to require 5½ minutes to sort. The price for the package is \$1500 per installation. ILLINOIS SYSTEMS CO., Maywood, Ill. For information:

CIRCLE 273 ON READER CARD

Edp Career Development

This vendor claims that edp has not yet matured as a profession, and that this is evidenced by undefined career paths, inadequate job descriptions, and inad-

equated professional training. The solution is claimed to be a service that provides documented job descriptions, paths, and training programs for departments and for individuals.

Part of the value of the service comes from the structure of the forms and of the interviews employed. A do-it-yourself kit that includes the physical pieces and a description of the methodology can be obtained for \$14,000. The value of the consulting portion runs the price to \$25,000 to \$50,000. Q.E.D. INFORMATION SCIENCES, INC., Wellesley Hills, Mass. For information:

CIRCLE 285 ON READER CARD

Text Editing

The TEXT text processor operates under Xerox' UTS time-sharing operating system on Sigma 6s, 7s, and 9s to provide a function equivalent to IBM's ATS. In fact, TEXT provides some functions, like automatic table generation and automatic indexing, which are not available in ATS.

Typists and technical writers can work interactively on teleprinter terminals or Selectric terminals to input any kind of document, then to alter those documents by addressing line numbers for changes. Global changes are accommodated, as are floating spaces for graphics.

TEXT requires 9K words for itself, plus and additional 2K for each user. It is available free to Sigma users. XEROX CORP., El Segundo, Calif. For information:

CIRCLE 286 ON READER CARD

PDP-8 Sort

A sorting package is offered to PDP-8 users having at least 4K of memory,

When they talk about data base management systems, experts say,
"ADABAS is IT!—actually better than advertised!"

ADABAS

ADABAS, the "ideal" data base management system, has a two-year proven reliable operational record with a variety of data bases and applications. ADABAS changes have focused upon efficiency, not functions.

The other systems do part of the job until you want a change—they, in fact, keep changing—you never "learn" them. ADABAS is the unique cost effective solution for a large number of data bases. The larger and more dynamic the data base, the larger the economic payoff from ADABAS.

ADABAS is available for byte-oriented computers and requires only 110K bytes of core . . . *without using overlays.*

With a day's training, people can use ADABAS effectively. With two weeks training, a computer center/user staff understands all the major facets of ADABAS and can take full advantage of its power.

We can convert your data base in less than a week.

Badge Recorder**

Model 80 Scanner

The conventional time card payroll system remains useful, but now there is a new computer compatible payroll processing system. The Model 75 Badge Recorder from Cincinnati is the payroll input of tomorrow.

The Model 75 saves real time and real money — there are no time cards to buy — no time spent delivering and picking up time cards — no sorting or auditing of time cards — no posting to payroll sheets. Team the Model 75 Attendance Time Data Collection System with your computer to cut clerical time and costs to a minimum.

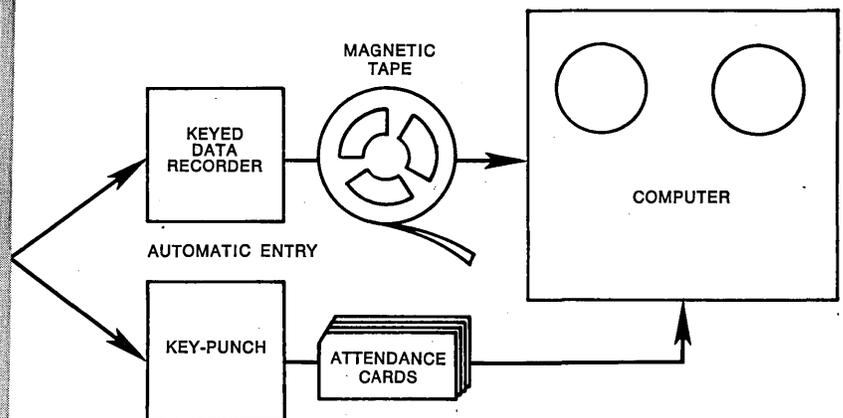

Each employee is provided with a credit card size plastic badge embossed with a modified bar code employee number. The badge is inserted in the recorder registering the time, date and identification number on carbon backed dual paper tape. The registration is man-sensible and can be visually checked by the employee through a window on the unit. It is also machine-sensible and can be converted to magnetic tape or punch cards at up to 120 registrations per minute via the Cincinnati Model 80 Scanner.

Take up reels hold tape for 2400 registrations per pay period. This means 100 employees per recorder can clock as many as four times each day for a normal work week with space for 400 registrations left over for overtime or extra employees. The master tape supply reel holds 10,000 registrations or about a one month supply.

When the time card system came in to being almost a century ago, it was a great innovation. The Model 75 is one-hundred years better. If it's time to cut costs, call the Cincinnati Sales Engineer listed under "TIME RECORDERS" in the Yellow Pages, or write for free literature on the Model 75 — our 75th anniversary — just in time.

Fenwal has more experience than any
other company in the world.*

People

It is difficult for anyone in the surging minicomputer business not to be an optimist. And the new king of the mini business—Digital Equipment Corp.'s ANDREW C. KNOWLES—is the king of the optimists, too. "I think the mini boom is just beginning," says DEC's new vice president in charge of minicomputers. "There are more than 20,000 minis out there now, and I can foresee two or three times that many—easy. And soon."

Andrew C. Knowles
and a display.

And how does Knowles propose to halt DEC's loss in minicomputer market share? He concedes that a phalanx of mini firms has been "sniping away" at DEC's base, but he feels the company is now not only in a position to maintain its market share, but will be able to increase it. "We have a complete line," observes Knowles. "On the low end, the PDP-6 dedicated controller costs \$1900; and, on the high end, the PDP-45 costs \$250,000. More than that, now that the PDP-8 and PDP-11 lines are mature, we're rough." DEC is the undisputed pacesetter in the mini business, having shipped well over 15,000 units. The firm's mini business runs at a rate of more than \$75 million a year.

Knowles' background at RCA's Semiconductor Div. in the early 1960s and later at RCA's Memory Products operation was useful when the minicomputer company purchased most of RCA's equipment at its Memory Products Div. in Needham Heights, Mass. Knowles joined DEC in late 1969 and became product line manager for the PDP-11 16-bit machine line. A former baseball star at the Univ. of Massachusetts where he earned a B.S. degree in electrical engineering, Knowles also did graduate work at Babson Institute. He succeeds Nick Mazzaresse, who is on a leave of absence.

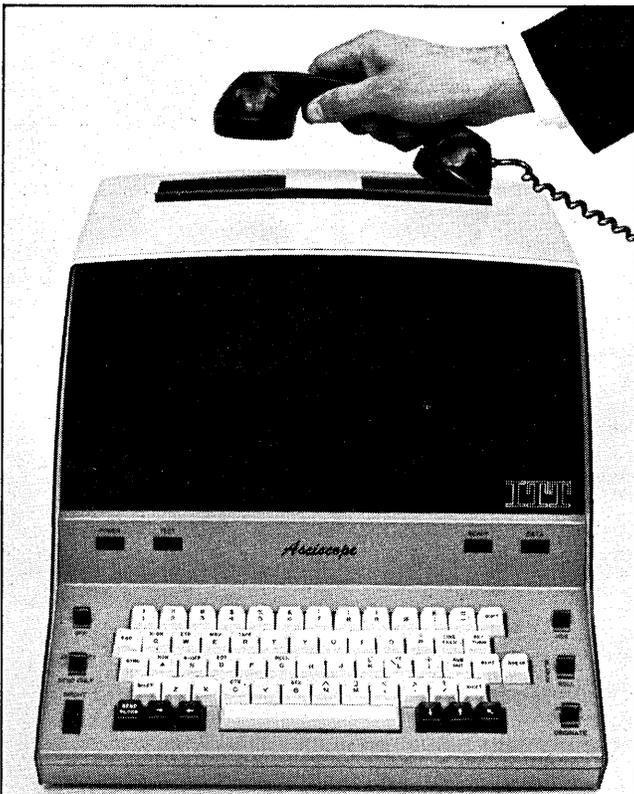

Another new and optimistic exec is VIRGINIA GODDARD, recently appointed vp, technical services, at Intercon Systems, a three-year-old international consulting and services corporation for which she sees a bright and bloom-

ing future providing technical support to government and industry. The company, with offices in Los Angeles, New York, and Tokyo, has a rapidly expanding task force, including optics designers, laser system specialists, design engineers, system analysts, CPA auditors, programmers, and configuration management specialists—and provides management and professional consulting services which range from the development of software for airborne computers to system auditing for a large corporation in Anchorage, Alaska.

Virginia H. Goddard
for a large corporation in Anchorage, Alaska.

A totally charming, soft-spoken lady, Miss Goddard foresees a task-oriented trend in dp consulting where the specialist will enter the project on contract at the point of origin, in the design and concept stages, and hopefully stay on for the life of the project—rather than just getting it launched or

**The brand new ITT
Asciscope™ display.**
*For \$65.00 a month you get a
complete computer terminal.*

At last... a silent, high-speed, compact desktop CRT display terminal with built-in modem and acoustic coupler. A complete package, including maintenance, for only \$65.00 a month.

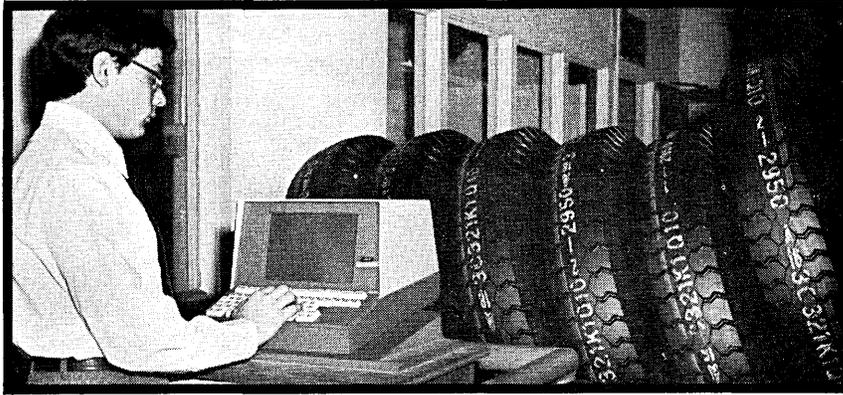

More good news: There's no complicated installation. All you need is a telephone or Data Access Arrangement, and you're in business immediately. And if the ITT ASCISCOPE you lease requires service—we'll replace it on the spot.

If you're ready for rapid, silent computer communications, with no need to reprogram TTY software routines, call (201) 935-3900 and ask for Jerry Porter, or write to ITT Data Equipment and Systems Division, Dept. 407, International Telephone and Telegraph Corporation, East Union Avenue, East Rutherford, N.J. 07073.

360/370

ITT Alphascope systems meet Firestone Tire and Rubber Company's computer display requirements, both for local applications such as inventory control ...

... and for remote applications, including control of nation-wide shipments.

Your 360/370 is only as good as your display systems. That's your best reason for ITT Alphascope.™

Because Alphascope systems are the only displays produced by a major company that has broad data plus communications resources: International Telephone and Telegraph Corporation, a world-wide leader in telecommunications.

ITT Alphascope display systems are designed to bring out the maximum potential of your System 360/370. They operate economically in remote or local modes, at high speeds. They're completely compatible with standard 360/370 hardware and software. All components install

easily, go to work immediately. Alphascope systems can improve your computer's cost performance, too. Compared with the computer-maker's displays, they can save you up to 25% every month. And ITT can be your single source for display terminals, printers, high-speed modems and low-cost 2701 replacement—all supplied as a total package. All supported by ITT.

You insisted on a computer from an industry leader. Shouldn't you demand the same quality in displays? Mail coupon for details.

coming in when disaster strikes.

In addition to a distinguished and diversified background in computer science, including management and technical stints with the U.S. government, IBM, United California Bank, the L.A. Times, Standard Oil of Calif., and most recently as vp, technical services, at Dart Industries, Miss Goddard has been active in ACM, ASM and DPMA.

While she strongly supports these societies, she believes there is an urgent need for the formation of one strong organization, similar to the American Medical Assn. and the Bar Assn., to speak for the industry with a united voice at a decision-making level. Legislation concerning the certification and/or licensing of dp personnel appears inevitable—and it is important that industry specialists assist in determining the requirements and qualifications, she believes.

You can't accuse PAUL ARMER of going to pots. Actually he has left POTS and moved to POSTS. Directionally, it's east to west. Armer, a DATAMATION contributing editor, recently took over as coordinator of the Program on Science,

Paul Armer

Technology and Society (POSTS) at the Center for Advanced Study in the Behavioral Sciences in Stanford, Calif. It's a program supported financially by the National Science Foundation at the nonprofit center, which is not affiliated with the university, although located on Stanford property. Armer will spend half his time as coordinator of the program, the other half as a Fellow of the center, trying to finish the book he had been working on at Harvard Univ. as part of the Program on Technology & Society (POTS) that had existed there.

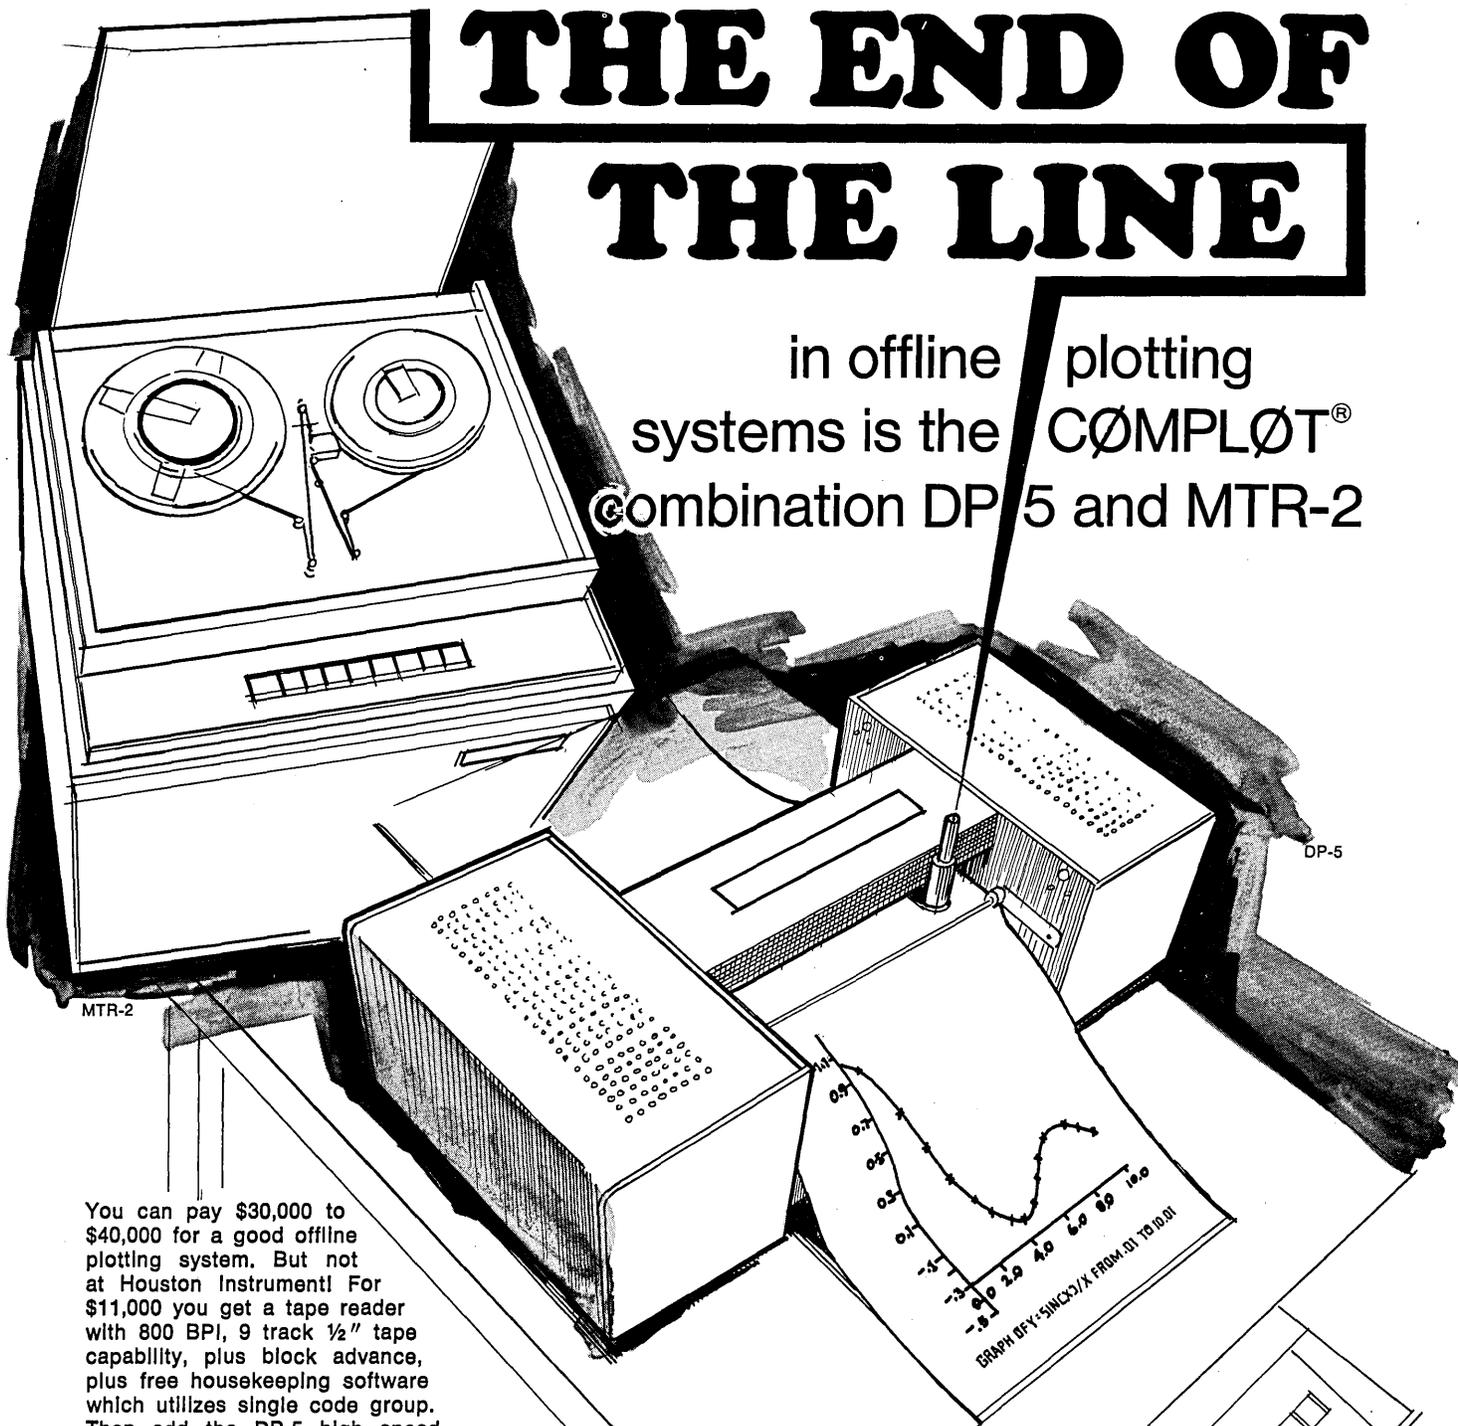

The 18-year-old center, situated on a quiet, wooded hill-top overlooking the university campus, provides a setting and facilities for study and contemplation for some 50 multidisciplinary scholars invited each year. Many arrive to complete one or more books they've been working on; others read or renew themselves in a variety of ways.

There, Paul Armer and the new program will "try to shed some light on the interaction among science, technology, and society," as he phrases it. Meanwhile, there's still his book on the Paul Principle and the problem of the obsolescence of a person's skills and knowledge resulting from rapid technological change. It's a phenomenon he used to call technological obsolescence; but, since discovering the social variety, he just refers to it as "obsolescence."

KARL E. WENK JR. is new to the computer business, with the typical new entrant's enthusiasm but an atypical newcomer's job. He's the new president of Intercomputer Corp., Phoenix manufacturer of a minicomputer and a front-end controller. Wenk is a long-time veteran of the finance business and was finding it static ("our product—dollars—might change in value, but never in character") when he became interested in data communications. As president of Ritter Finance, he was a prime mover in a consortium of finance companies which were attempting to develop a credit-checking network. "I sensed a growing interest in the whole field of data communications," he said, explaining his big switch. One of his first accomplishments at Intercomputer was completion of negotiations with UCC subsidiary, Communications Systems Inc., on an oem contract under which Intercomputer will produce, and CSI will market and service, a line of IBM-compatible front-end controllers. □

THE END OF THE LINE

in offline plotting systems is the COMPLØT® combination DP-5 and MTR-2

You can pay \$30,000 to \$40,000 for a good offline plotting system. But not at Houston Instrument! For \$11,000 you get a tape reader with 800 BPI, 9 track 1/2" tape capability, plus block advance, plus free housekeeping software which utilizes single code group. Then add the DP-5 high speed incremental plotter for another \$11,000 and you're in business. Plotting speed is 1200 increments/second. Step size is factory set at .005" or .0025".

The system makes offline plotting an economic reality. Write today for a complete brochure on offline plotting. Oh yes, the MTR-2 accepts IBM compatible tapes.

BREAKTHROUGH!

ITEL's unique new Packaged Lease Program may be the most significant announcement since the introduction of the 370.

Now there's a new way to lease an IBM System/370 from ITEL on a short term basis with complete flexibility and surprisingly large savings. The ITEL Packaged Lease Program lets you lease a complete computer package consisting of System/370, ITEL Disk Drives, ITEL Tape Drives and AMS Monolithic Memory.

Lease terms range from 3 to 8 years, and savings can be as great as 60% of IBM rental!

ITEL's Packaged Lease Program may be the most comprehensive leasing program ever offered. Just look at the advantages of this package: All equipment is from a single source, ITEL. You can upgrade from one model of 370 to another during the terms of the lease. You get

advanced technology Disk Drives, Tape Drives and Monolithic Memory. And you get remarkably flexible lease terms.

ITEL has the unique capabilities required to make such a lease: financial resources and expertise. (ITEL has over \$260 million in 360 and 370 leases in effect.) Monolithic Main Memory from Advanced Memory Systems, Inc. Disk Drives from our Information Storage Systems Division, which have set the industry standards for reliability. And now Tape Drives.

Get all the facts on ITEL's Packaged Lease Program. **CALL THE PRICE/PERFORMANCE PEOPLE AT ITEL.**

Books

Computers and Political Campaigning

by Robert L. Chartrand
Spartan Books, 1972
220 pages. \$5.00 (paperback)

Mr. Chartrand is the specialist in information sciences for the U.S. Congressional Research Service and has served in political environments for about a quarter century. However, in spite of bipartisan testimonials to the contrary, this reviewer does not feel that the quality of his book is commensurate with that of his credentials. The foreword and other areas of the book quite explicitly state that its audience is to be the nontechnician. However, in his introduction, Mr. Chartrand states his agreement with a quotation to the contrary that there is a shift of "political power from party leaders, political brokers, and special interest group leaders to those who are information and communication experts." His first chapter, "Information Technology," is geared to the information scientist, not to the politician.

Succeeding chapters shift between the level of comprehension of the data processor and that of the politician. Perhaps the most appropriate audience would be the technical administrators of the more sophisticated political campaigns—not the politicians who employ them nor the data processors hired by these administrators.

If the audience is to be these technical administrators, then it appears that the content of the book is unfortunately stratified. The preface promises that:

"Campaign files and their computerization are discussed thoroughly, including such essential data as those used by campaign workers, correspondence and financial records, and analytical commentary based on political research.

"Beyond the mundane organization and manipulation of these basic files are the more exotic uses of the computer, such as simulating through the use of a computer model how groups of voter types may act (or react) politically."

Although the author largely fulfills the promised discussion of file organization and processing, only ten pages in the text are devoted to math-science applications (seven of which address a 1960 application). Furthermore, he continually confuses supervision and management by shifting his scale of exposition from such details as the need for and the structure of back-up files to theoretical questions of the role of data processing in campaigns.

Generally the text divides into a discussion of information for using edp in

politics, a chapter on file creation—which would normally be followed by his rather thorough discussions of campaign files but is interrupted by a chapter on the historic approaches of the Republican and Democratic National Committees to edp in political campaigning—the extremely anemic chapter on simulation and modelling, a chapter on election night prediction by national media, and finally some recommendations for development of issues-oriented files for future use. Three appendices: (A) a case study; (B) a table of data processing costs; and (C) a registry of political consultants, along with a bibliography and glossary, follow.

Mr. Chartrand does identify some interesting applications of edp to political campaigning in his chapter "Campaign Files." In the section on Constituent/Voter Files, besides addressing censuses of party registrants, he points out that at least one direct mail advertising firm is prepared to merge data generated from credit bureaus, governmental agencies, etc. with the preceding censuses in order to create and update a "Political Data Bank System." It is rather a chilling thought that he suggests that the parties might recoup the costs of the system by selling the data in the commercial market. On a more socially positive note, less ambitious data base efforts enabled the

deployment of mobile registration vans in Nassau County, N.Y., which increased the effectiveness of voter registration efforts by reducing average registration time per registrant from one person every ten minutes to one every 90 seconds.

The section on Financial Files, besides addressing the more pedestrian issues of housekeeping, discusses the use of historical files of contributions by individuals and their application to selective fund raising solicitations. The opportunity that this technique renders for exerting pressure on noncontributors raises the specter of political extortion.

The section on Campaign Worker Files discusses the opportunity to rationalize campaigning through critical path networking. Mr. Chartrand points out that little use has been made of this tool at least through the 1968 campaigns. Other aspects of the discussion of computerized campaign worker files include clerical replacement and the development of precinct walking lists. Unfortunately, the author viewed them purely as tab runs and did not offer approaches to assigning the work through the use of service area programs such as REDIST.

The sections on Political Research and Issues Files and Biographical Files both lack discussions of cost-effectiveness. However, his analysis of the ca-

This is the complete electronic security access control system.

The only one.

Instant central lock-out or acceptance or change of authorization of any individual card for any door. With records.

As space-age as your data center.

In the electronic age mechanical locks and keys are obsolete. And gate guards on every critical entrance, inside as well as outside, would cost a fortune.

Rusco's mini-computer R-40 access control security system gives you complete, economical, automatic control, with printed records, 24 hours a day, of every critical access point—into the building, into areas, into computer rooms, into storage. One entrance or scores. Dozens or thousands of people... individually. You can instantly lock out any individual from any entrance, merely by flicking a few switches at the central console... **and you don't have to change the lock or recover the card.**

Or you can change the authorization of any individual from one entrance to different entrances, without changing the locks, or his card. Total control.

You have an automatic record of date, time, entrance, and individual card, for time-recording or other purposes.

The full memory capacity is always available. No loss because cardholders have been eliminated. Any card can be authorized for any door, as specified by central control.

Entrance controls may operate with an authorized card, or may also require a secret, memorized code tapped in on a keyboard by the cardholder.

The R-40 system works with the extraordinary Ruscard. Same size and thickness as a standard credit card, and just as convenient to carry and use. **It can be printed, embossed, and embody an ID photo, and it can be**

used on any standard imprinter, for total compatibility with other requirements of documentation.

But it also can be coded invisibly with a complex variety of information. Secure. So secure an advanced electronic laboratory writes, "...we...were unable to break the code."* No worry about counterfeiting, or duplication, or loss. When the extraordinary Ruscard is inserted into any of the appropriate Ruscontrols, if it is valid for that control at that time it will activate a door opener or other device.

If it is not valid, if the employee terminated yesterday, or if his access has been changed from one entrance to another, or from the first shift to the second shift, or if

an attempted entry is made using a lost or stolen card, the Ruscontrol will not be activated.

Entrance denied. (With alarms, if desired!)

And you don't have to change the lock or recover the card.

Write or phone for complete information.

*Complete letter available on request.

RUSCO ELECTRONIC SYSTEMS

A RUSCO INDUSTRIES COMPANY

P.O. BOX 2848D, PASADENA, CALIFORNIA 91105 (213) 682-3691

books

veats and benefits of Survey/Polls Files is particularly lucid and thorough. He succinctly discusses the questions of validity, obsolescence, completeness, relative importance, quantitative predictability, and relevance. He also knowledgeably handles the usefulness of "Vote History Files" by demonstrating how they can identify "swing" and "soft" precincts as "target" areas in which maximum campaign efforts should be expended.

The only contribution of Mr. Chartrand's chapter on Simulation and Modelling is the statement that time series voting statistics by precinct are available and the precautionary statement of vital differences in modelling local and national campaigns. "Those who have worked with local computer models point out that there are important differences between these and a computerized simulation on a national scale. Essentially it is necessary to predict individual rather than group opinions, and these are less reliable than bloc reactions."

Mr. Chartrand's ignoring such advances in political modelling as media impact simulations is topically unfortunate in light of George McGovern's weak victory (less than expected) in

the California Democratic Presidential Primary. Political analysts have attributed the 15% difference between Sen. McGovern's anticipated and actual vote to the impact of Southern California's media. This phenomenon could have been projected by political models developed since the late 1960's and they should certainly have been included in *Computers and Political Campaigning*.

In summary, in spite of some well

written sections, the book is inconsistent in its direction. In its dealing with the role of edp in campaigning, it shifts its scale from the details of the data control desk to general structures and procedures. It displays a lack of awareness of the capabilities of third and fourth generation systems. In so doing, it raises questions that would be more relevant if the title were "EAM and Political Campaigning."

—Alan Weiner

Book Briefs

Manager's Guide to Management Information Systems

by Robert V. Head
Prentice-Hall, Inc., Englewood
Cliffs, N.J., 1972
176 pp. \$12

This is a useful book for nontechnical top management people who expect to interact, as users, with an information system for problem-solving purposes and who are responsible for directing (and challenging) system development projects in their companies.

It discusses the role, structuring, and maintenance of data bases from technical and managerial viewpoints; the way in which managers interact with a

management information system, with emphasis on on-line hardware and software; the problems involved in justifying an MIS; and the system development process, its alternatives and organization. Also included are a glossary of MIS terms and a bibliography (with abstracts) of books for the non-specialist on subjects covering the various disciplines that contribute to MIS.

The book is well organized, easy to read, and should give managers sufficient background to intelligently consider and discuss management information systems within their own organizations. It also serves as an overview for business school students and gives analysts, programmers, and other specialists a broader picture of the information systems to which they are contributing in their specialized ways. □

Datum... the miniperipheral people with systems know-how

**Most things for most minis with
flexibility...**

Magnetic tape systems

DATUM's I/O systems let you add up to four magnetic tape units to any of 20 makes of minicomputer. Seven- and nine-track mix, NRZ and phase-encoded formats, different densities, several speeds and compatible software.

Key conversation piece in the mini-tape dialogue is DATUM's Series 5091 Formatter. This lets you generate and read IBM-compatible NRZ and/or phase-encoded formats. One formatter will handle up to four 7- or 9-track, multiple density (200, 556, 800 bpi), multiple-speed (6.25 to 112.5 ips) magnetic tape units. Plug in a computer adapter and you have a complete controller system. Daisy-chain two formatters and control up to four 7- and 9-track NRZ plus one to four 1600 bpi tape units.

Almost 600 DATUM magnetic tape systems are operating reliably here and abroad. They're field-proven.

We like to provide you with a total system—tape units, formatter/controller, software, installation and all the expertise derived from decades of systems experience. But we also furnish formatters with blank PC boards for the knowledgeable systems man who wants to build his own computer adapter. These boards have 196 IC sockets already mounted. DTL/TTL integrated circuit logic is used throughout the formatter design to ensure compatibility.

Total systems prices start about \$8000. Delivery off-the-shelf much of the time, 30 days to be on the safe side.

Circle 72 on reader card

performance...

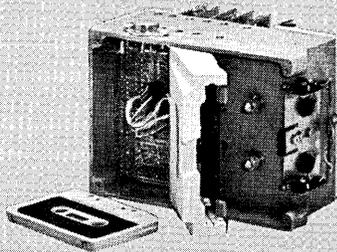

Digital cassette systems

DATUM's cassette systems create new standards of performance. Using the Peripheral Dynamics Model 4200 Digital Cassette Transport—the cassette with reel performance—these systems offer:

storage capacities of over 20 million bits, two- or four-track recording at speeds from 10 ips to 75 ips, NRZ or phase-encoded formats, read/write or read-after-write heads.

And no more tape-chewing. A reel-driven servo system, without capstans or pinch rollers, keeps tape velocity constant. A torque feedback tension servo maintains tape tension. A reference-edge tape guidance system provides precise tracking (± 0.001 inch) and cuts skew to less than 2 microseconds at 37.5 ips. So tape will last.

Standard speed is 37.5 ips, though you can have up to 75 ips or down to 10 ips. Search and rewind speed is 120 ips. Operates bidirectionally at high or low speeds, under local or remote control.

Reliability? It's the simplest cassette drive on the market. Two moving parts in the drive mechanism. No springs, capstans, pinch rollers or solenoids to get out of whack. It is as reliable as it is simple.

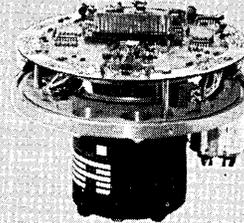

OEM versions or systems, with the same formatters, controllers and software as with conventional reel-to-reel tape drive systems.

Circle 90 on reader card

reliability...

Mass memory systems

DATUM's mass memory systems—drums or disks—offer low cost expansion to core-limited minicomputers, or solutions to other storage problems requiring a highly reliable, rapid-access, economical data base.

At the lower end of the storage scale, DATUM's Series 55 rotating drum memories provide 2K 16-bit word capacity with 18,000 bits per track on 2 tracks and an average access time of 8.3 milliseconds, for about \$650. Common capacities of 32K and 65K words run from \$1550 to \$1750 with self-clocked, read-write electronics.

Series 88 drums, rugged and reliable, provide up to 1.2 million words of storage. Designed for tough environmental conditions, high vibration and shock-prone applications.

All drums have head-per-track, fail-safe, flying heads. And low cost per reliable bit.

DATUM's new Series 44 dual disk drives are designed primarily to provide both sizeable on-line random access storage and unlimited off-line storage. Small system compactness and price, with big system features like top-loading removable disks, air filtration systems and optical head positioning. Storage capacities to about 3 million words.

Look Ahead

(Continued from page 8)

investors, has a portable time-sharing terminal with graphics capability and nonimpact printing speeds up to 120 cps. Its 40-pound Teletype replacement has an acoustic coupler and prints alphanumerics and graphics on electrosensitive paper. It produces characters with a 5x7 dot matrix.

Meanwhile, we hear Honeywell is developing a 15,000-lpm nonimpact printer that uses treated paper.

GSA LIABILITY HASSLE SETTLED--MAYBE

The hassle between GSA and cpu makers, chiefly IBM, regarding "consequential damage" (May, p. 122) is near settlement--at least for a while. The agency is willing to accept liability for such damage. But a key source says there still may be a need to increase suppliers' liability beyond the limits specified in current liquidated damage, nonperformance, and related contract clauses. GSA wants to establish a government-industry study group to define "consequential damages" and explore possible contract changes. It would be given "no more than two years" to produce recommendations.

Also at GSA, Control Data Corp. signed its FY'73 federal supply schedule contract, and three other mainframe suppliers, unnamed, are reported on the verge of doing likewise. IBM remains a holdout. CDC and at least one other mainframer have agreed to let the feds attach independently supplied peripherals to their leased cpu's. A government source expects similar concessions from the others.

IS THERE LIFE AFTER DEATH?

When GE's computer division perished, there was a warehouse full of assorted computer equipment left over. Now an enterprising Los Angeles company, Media Images, whose main business is supplying computer services and processing, has bought the whole works for "pennies on the dollar." Estimated original purchase value is \$45 million, and the inventory includes a 225, 235, 425, two 645s, lots of peripherals, 11,000 circuit boards, and the complete TRADAR system. It's all been moved to Media Images' warehouse in Santa Ana, Calif., and the company has already made its first sale--a 625 cpu to Honeywell Information Systems.

RUMORS AND RAW RANDOM DATA

Datamation, with the cooperation of the U.S. Dept. of Commerce, will sponsor a "Grand Tour, Europe '73." The combination conference and exhibit will hit five European cities starting in November of next year...Watch for Burroughs to announce semiconductor memory later this year for the 6700 line...Transcript of the government's antitrust case against IBM includes a statement from an IBM attorney who says General Electric and RCA are both in the computer business, "and I believe I can prove (it)." Some consolation to those who lost their jobs or were left holding an RCA or GE computer when those firms went out of the mainframe computer business...General Computer Systems, the Texas-based key-to-disc firm, sold three systems to companies that were using equipment made by the defunct Redcor Corp. Not surprising--marketing vp Dallas Talley and the GCS New England and Central U.S. managers are ex-Redcor marketeers. Computer Machinery Corp. earlier this year took over the Redcor customer base... According to IBM insiders, "Smash"--supposed code name for IBM's virtual memory announcement--has nothing to do with "smashing" the competition. They say it came about when a market strategist, trying to decide when and what new products to announce, exclaimed: "Let's announce the whole smash." The term caught on.

the compatible **FACOM** family computers for every purpose

We always had our own ideas about designing computers. We realized that too many computers on the market were made expensive by too many features, features you had to pay for and possibly never used. So we designed the unique mini model FACOM R-E, a paragon of performance and economy.

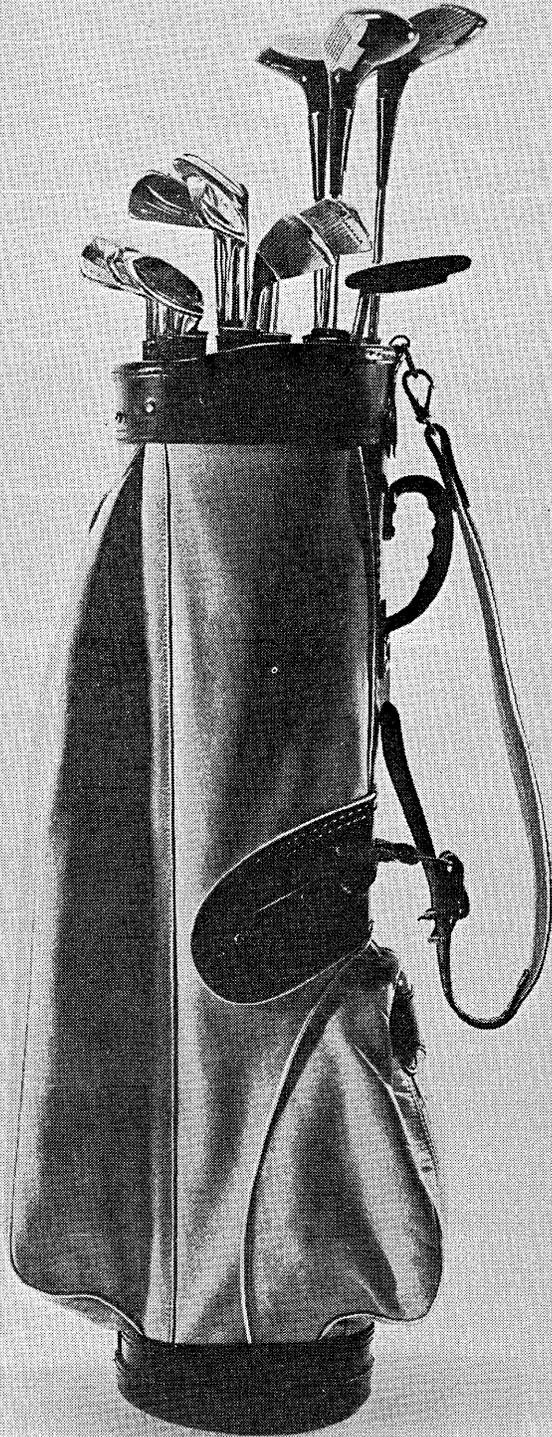

On the other hand, computer needs grow as business grows, and we designed systems that can grow right along with demands. Take our FACOM 230-25, for instance, which speaks about every computer language available, and features multi-level interruption and memory protection when working on different problems concurrently.

And for those who have big requirements from the start, we designed a huge time-sharing system, the FACOM 230-60.

All in all, we can offer 14 basic models, and for each model a choice of the latest peripherals and complete software packages.

So whenever you need a compatible computer, take a look at our FACOM family. Every model is a paragon of performance and economy.

Cassettes— Latest Growth Market?

The rapid growth of minicomputers and key-to-tape systems during the late 1960s provided a significant market for the low-cost reel-to-reel tape unit. But during the 1970s the digital tape cassette recorder will take center stage as vast markets open up for key-to-cassette systems, point-of-sale recording systems, paper tape replacements and remote data terminals requiring bulk memory.

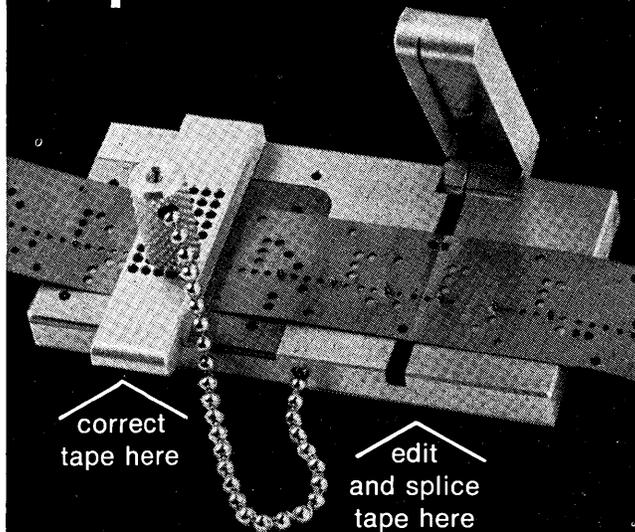

History evolves rather than repeats and this is particularly true of the digital tape recorder. Originally, the only units available were very large, very fast and carried a very big price tag (in excess of \$20,000). In the early '60s, companies like Datamec, Ampex and Potter brought out smaller, slower-speed tape recorders in the \$10,000 price range to satisfy the needs of systems people. In 1967, Peripheral Equipment Corp. (now PERTEC) came along with a \$3,000 tape unit and a number of other manufacturers followed suit. The next major evolution is the digital cassette recorder which will carry a price tag of \$300 or less in large OEM quantities.

Actually, the computer industry has only taken the digital cassette seriously for the past three years and, after evaluating some of the early kludges, many industry experts seriously doubted if enough performance and reliability could be built into a digital cassette drive to make it suitable for recording and playback of computer data.

However, during the past year, the digital cassette recorder has come of age. Tape specifications have been standardized. There have been some major technical breakthroughs in cassette drive design which make it possible to achieve performance and reliability on a par with the smaller IBM compatible reel-to-reel machines. Today, a few mature cassette drive manufacturers have emerged from the pack, ready to slug it out for the big pot of gold on the horizon.

Most industry experts agree that the potential market for digital cassette recorders is enormous. However, even veteran researchers like Quantum Science and A. D. Little are having a difficult time projecting the absolute size of the market on a year-to-year basis because of the uncertainty of how fast new markets will develop. The growth rates in the various surveys are similar, but these curves can shift forward or

Now, edit, splice and correct tape with just one, compact, super-accurate unit.

Arvey's 3-in-1 Hand Punch & Splicer

Up until now, you've probably been editing and splicing on one unit, and correcting tape on another. No longer. With Arvey's new Hand Punch and Splicer, you can do all three using any 5 to 8 track paper or mylar punched tape. But there's much more to the Arvey Hand Punch and Splicer.

It's really a precision instrument. Extremely lightweight and compact. Use it anywhere! It's easy to use! Makes perfect, effortless cuts every time. Accurately positioned guide pins hold tape firmly in place. So each splice is precision perfect, and complies with BIMA standards. Easy-to-apply, pre-perforated, self-sticking patches come with each unit, and work at all code levels. And to correct tape, there's a built-in safety feature. The punch arm must lock perfectly over tape before punch can enter. No more torn tape or wrong punches.

Efficiency. Perfection. Precision. That's what our Hand Punch and Splicer is all about. See for yourself and try the perfect instrument . . . Arvey's 3-in-1 Hand Punch and Splicer.

And of course you know about the full Arvey line of high quality NC Tapes.

CIRCLE 102 ON READER CARD

backward for a year or so. By taking a consensus of the available studies, it appears that the digital cassette market will be between \$60 and \$90 million annually five years from now, with exact timing dependent on the introduction of new cassette-oriented products by the large point-of-sale suppliers. Some of the most important markets for digital cassette recorders include:

Key-to-cassette systems. Key-to-reel-to-reel tape systems have already given the old punched card quite a battering. Key-to-cassette systems, with a much lower price tag, may well deal a knockout blow to the punched card and make edp available to even the smallest businesses.

Point-of-sale-recording systems. Here is an even bigger potential market for cassettes with such industry giants as NCR, Friden, General Instrument, TRW Data Systems, Pitney Bowes, and Olivetti taking dead aim at every department store, discount house, franchise chain, supermart, drug store, motel and gas station in the free world. There is no doubt that digital cassette recorders will show up by the hundreds of thousands in point-of-sale and accounting equipment.

Remote data terminals. This is another big potential market since manufacturers of hard copy teleprinters and crt terminals are finding that the digital cassette is an appropriate mate for their products where bulk storage is needed.

Replacement for punched paper tape. Like the punched card, the punched paper tape has as many

lives as the proverbial cat. Eventually, however, the digital cassette will make strong inroads into this broad price-competitive market.

Right now, the biggest competitor to the digital cassette in low-cost storage is the 7-inch reel-to-reel machine. The going price for a 7-inch tape unit is \$1400 to \$1600 in quantity. These prices may drop to \$1200 eventually, but won't get below \$1000 because of the necessity to accelerate and control this large mass of tape.

The ¼-inch cartridge machine is another worthy contender. IBM, along with others, is seriously considering this approach. It is logical that the ¼" concept will find a niche in systems where additional data capacity justifies a much higher price than a cassette drive. If a ¼" machine can be produced without tension arms, the price could run close to \$700 in very large quantities. However, this will still be more expensive than the ⅛" cassette drive. There appears to be room for both quarter and eighth-inch devices. They will compete head-on in some areas, overlap in others, but in most cases they will find distinct markets. The cassette, because of its lower price, should reap the lion's share of the business because its capacity is more than sufficient to take care of a day's typing, a day's cash register receipts or replace thousands of punched cards.

Another possible challenger to the digital cassette is the flexible "floppy" disc, which has the advantage of fast random access and high transfer rates. However, since manufacturers of these discs are quoting prices of \$2000 and up, it appears that the flexible disc and the digital cassette drive will be more complementary than competitive, just as disc files and reel-to-reel tapes both have a place in large computer systems.

It appears that the manufacturers who will be most successful in the digital cassette drive sales race will be those who stick to simple design, rather than attempting radical approaches involving belts, pulleys, clutches and other mechanical nightmares. Some cassette drive builders like Bell & Howell and Dicom believe that the tape must be pulled out of the cassette, using mechanical or vacuum methods. This technique is unique, but it appears to be an unnecessarily expensive solution to tape control. Other manufacturers have taken the same design approach as for reel-to-reel tape recorders. An example is the Interdyne cassette drive which uses a DC capstan motor and a pair of DC reel motors to control tape velocity and tension and a simple back EMF servo circuit in place of the feedback tachometer. The overall result is a digital cassette drive that uses very few components yet rivals the reel-to-reel tape recorders for performance and reliability.

The big explosion should take place soon. The major suppliers of point-of-sale equipment are ready to make major plunges into mass markets. There are scores of exciting new products in the pipeline which will use digital cassette drives. It appears that four or five cassette recorder manufacturers, at the most, will share the business. These are the ones who have solved the problems which broke the back of some 24 suppliers during the past 24 months. The successful survivors will offer equipment which:

1. Has high performance and reliability.
2. Has error rates approaching reel-to-reel transports.
3. Causes virtually no down time.
4. Is priced below \$300 in large OEM quantities.

Bell Canada Executive Appointment

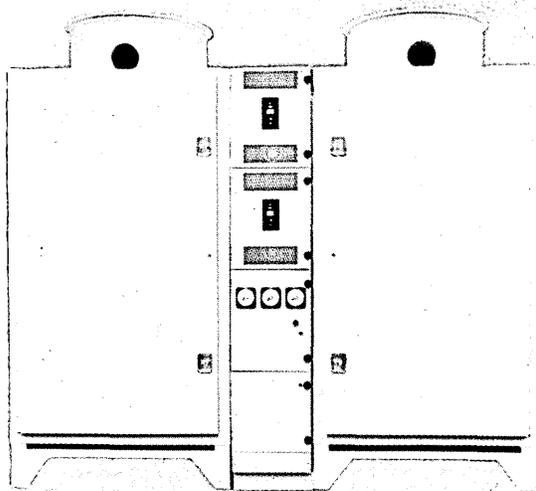

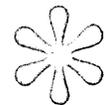

LAWRENCE J. O'KEEFE

Bell Canada announces the appointment of Lawrence J. O'Keefe as Vice-President (Systems), with responsibility for the direction and further development of the Company's internal business information systems, activities and data centre operations. Mr. O'Keefe has had extensive experience in both the hardware and software aspects of computer-based information systems at IBM, the St. Regis Paper Company, ITT and Faberge Incorporated in New York City.

UPS

NO DOWNS

*** Uninterruptible Power Systems**

When your computer plugs into an ordinary power line, it has no way to go but down.

Voltage spikes, dips, flickers, transients and out-and-out outages mean costly down time and recoveries. And a loss of real-time data.

Teledyne Inet ends the "downs" with uninterruptible power — from the most dependable on-line solid state Uninterruptible Power System in the World. It never fails to deliver a continuous flow of pure, precise AC power, no matter how many failures or outages you have.

Read up on UPS. Write Teledyne Inet, 711 West Knox Street, Gardena, California 90248. Or phone (213) 327-0913.

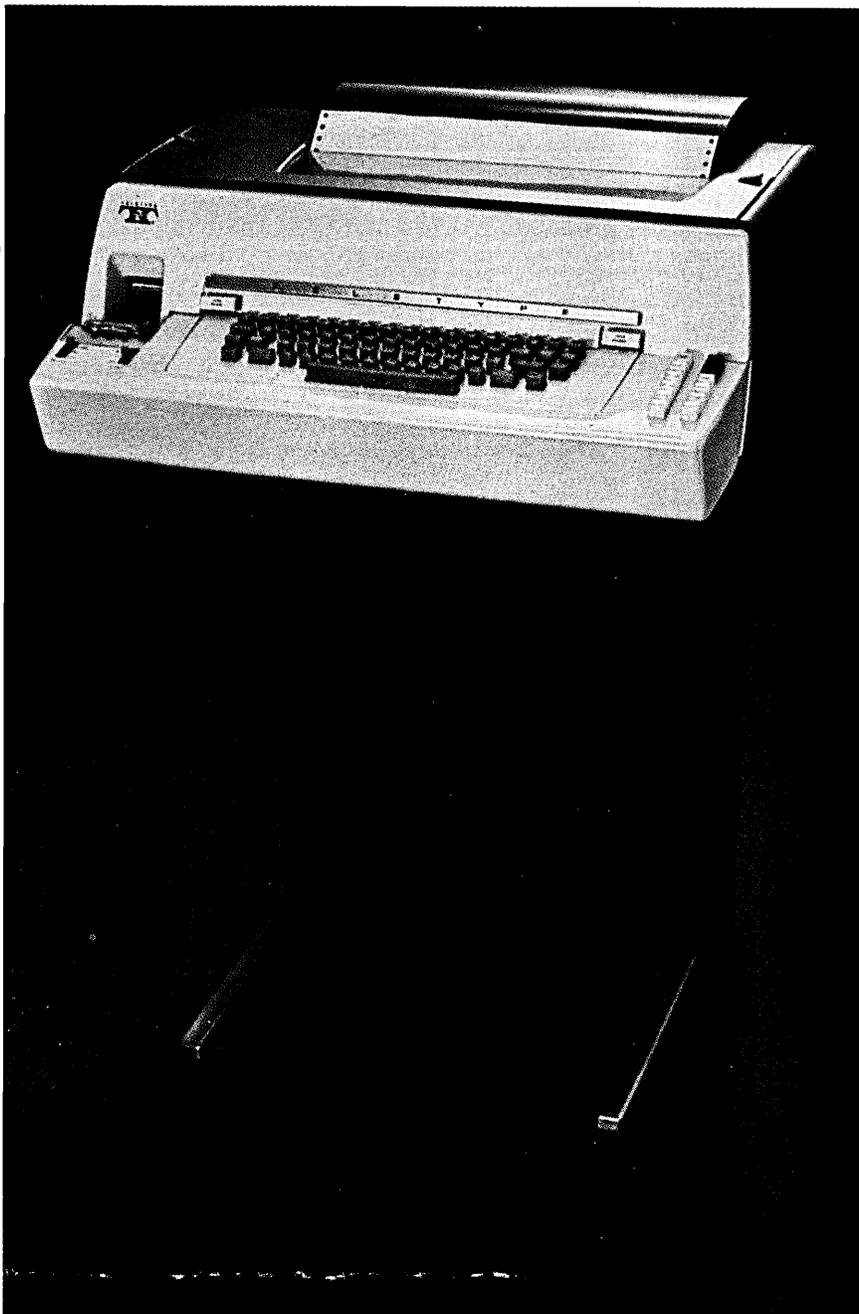

Remember.
What goes UPS can't go down.

TELEDYNE INET

... PIONEERS IN PRECISE POWER

**Our new model
38 series.**

**Even the most
expensive ASR is
a very inexpensive
\$1430.***

Teletype is a trademark registered in the United States Patent Office.

Just because you need big machine features, you don't have to pay big machine prices.

Not when you've got some new alternatives: the Teletype® model 38 series terminals. They offer a lot of features. For only a little money.

Prices for an RO model 38 start as low as \$905. KSR model 38 terminals begin at \$1168. Even ASR terminals go for as low as \$1402. And for less than \$200, you can equip any of them with a built-in, factory-tested modem.

Standard equipment on all model 38 terminals is a 132-character printing format on a 15-inch wide platen. Upper and lower case is also standard. So is two-color printing.

Speed? 100 words per minute. If you need more—up to 2400 wpm—the model 38 interfaces with the Teletype 4210 magnetic tape data terminal.

There's more, too. Like plug-to-plug compatibility with the model 33. So you can update your system without changing it.

The new Teletype model 38 series terminals. Where else can you get so much for so little?

It takes more than manufacturing facilities to build the machines Teletype Corporation offers. It also takes commitment. From people who think service is as important as sales. In terminals for computers and point-to-point communications.

That's why we invented a new name for who we are and what we make. The computer-communications people.

For more information about any Teletype product, write or call: TERMINAL CENTRAL; Teletype Corporation, Dept. 81N, 5555 Touhy Avenue, Skokie, Illinois 60076. Phone 312/982-2500.
